

# Intimidator Visual Bird Deterrent

## WHAT IT DOES

A patented, holographic avian deterrent system, designed to visually deter woodpeckers and other troublesome birds from open areas, such as siding, eaves, ledges and rooftops

## WHERE IT GOES

The custom bracket allows the deterrent to be attached to most substrates with only one screw, or it can also be mounted to magnets for easy attachment to ferrous metals. Simply attach to substrate around the affected areas where sun exposure is available. Application recommended on highest points of structure in most cases

## HOW IT WORKS

Depending on angles and structure, more deterrents may be needed. Typical coverage for deterrents is between a 20 to 30 ft. radius, depending on sun exposure. The upper mechanism is designed for medium to high level winds, while the lower mechanism is designed for low to medium level winds. Studies have shown the two-part system to be more effective at scaring birds with erratic movements and light patterns than other visual deterrents.

Woodpecker - Silver

Starling - Gold

Shore Bird - Red
