Sound pressure level dB(A)	78,6	
Ambient temp. for storage	-20°...+70° C	
Temperature for use	-10°...+60° C	

## Overview - Working fields

### Working field

The working field shows burner output as a function of combustion chamber pressure. It corresponds to the maximum values specified by EN 267 measured at the test fire tube. **The efficiency rating of the boiler should be taken into account when selecting a burner.**

Calculation of burner output:

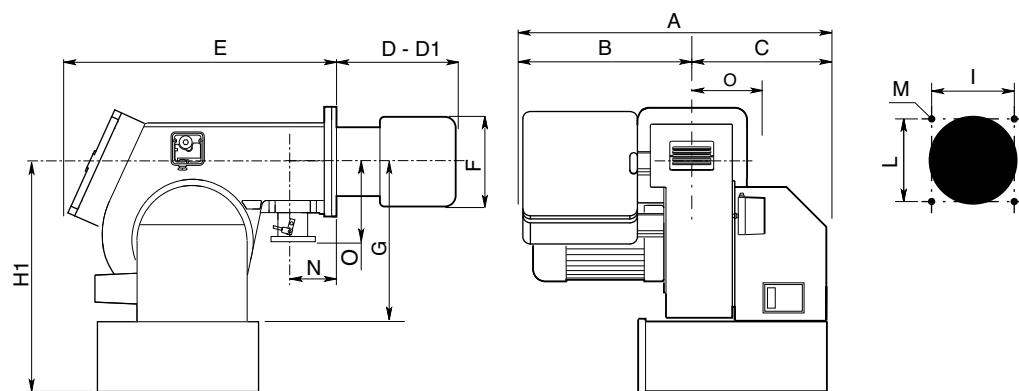

$$QF = \frac{Q_N}{\eta_K}$$

QF = Burner output (kW)

QN = Rated boiler output (kW)

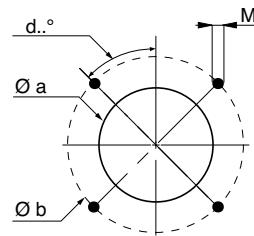

$\eta_K$  = Boiler efficiency (%)

## Overview - Dimensions

### Important notes

BLU burners are designed for the low-pollutant combustion of natural gas and Liquefied Petroleum Gas. The design and function of the burners comply with standard EN676. Assembly and commissioning must be carried out only by authorised specialists and all applicable guidelines and directives must be observed.

### Burner description

BLU are two-stage, fully automatic, monoblock type burners. The special design of the burner head provides low-polluting combustion with high efficiency. In line with testing as defined by EN676, the values comply with emissions class 3 ( $\text{NO}_x < 80 \text{ mg/kWh}$ ). Emissions values may differ, depending on combustion chamber dimensions, combustion chamber load and the firing system (three-pass boilers, boilers with reverse firing). They are suitable for use with all heat generators complying with EN 303 or for use with hot air generators complying with DIN 4794, and DIN 30697 within their respective performance range.

Use for any other application requires the approval of Ecoflam.

The following standards should be observed in order to ensure safe, environmentally sound and energy-efficient operation:

#### EN 676

Forced-draught gas burners

#### EN 226

Connection of fuel oil and forced-draught gas burners to a heat generator.

#### EN 60335-1, -2-102

Specification for safety of household and similar electrical appliances, particular requirements for gas burning appliances.

#### Installation location

The burner must not be operated in rooms containing aggressive vapours (e.g. spray, perchloroethylene, hydrocarbon tetrachloride, solvent, etc.) or tending to heavy dust formation or high air humidity. Adequate ventilation must be provided at the place of installation of the furnace system to ensure a reliable supply with combustion air.

Variations may arise as a result of local regulations.

**We can accept no warranty liability whatsoever for loss, damage or injury caused by any of the following:**

- Inappropriate use.
- Incorrect assembly or repair by the customer or any third party, including the fitting of non-original parts.

### Provision of the system and the operating instructions

The firing system manufacturer must supply the operator of the system with operating and maintenance instructions on or before final delivery. These instructions should be displayed in a prominent location at the point of installation of the heat generator, and should include the address and telephone number of the nearest customer service centre.

### Notes for the operator

The system should be inspected by a specialist at least once a year. It is advisable to take out a maintenance contract to guarantee regular servicing.

Ecoflam burners have been designed and built in compliance with all current regulations and directives.

All burners comply to the safety and energy saving operation regulations within the standard of their respective performance range. The quality is guaranteed by a quality and management system certified in accordance with ISO 9001:2008.

### BLU 1700.1 - PR TC GN - 230-400-50 ETS

#### RANGE NAME BY FUEL TYPE

**BLU** Gas

#### MODEL SIZE (Gas: kW; Oil: kg/h)

**BLU 1700.1** 1770 kW

#### EMISSIONS

- Standard Class 2 - GAS EN676 (<120 mg/kWh)
- LN** Low NOx Class 3 - GAS EN676 (<80 mg/kWh)

#### OPERATION TYPE

<b>PAB</b>	2 stages soft start
<b>PR</b>	2 stages progressive mechanical
<b>MD</b>	2 stages modulating mechanical with PID
<b>E</b>	2 stages modulating electronic

#### HEAD TYPE

<b>TC</b>	Short head
<b>TL</b>	Long head

#### FUEL

<b>GN</b>	Gas natural
<b>LPG</b>	Liquid gas
<b>BIOGAS</b>	Biogas

#### EQUIPMENT

- with gas train
- SGT** Separate gas train

#### ELECTRICAL POWER SUPPLY

**230-400-50** 230-400 Volt, 50 Hz

#### CONTROL BOX

**ETS** Lamtec Etamatic S

#### Scope of delivery

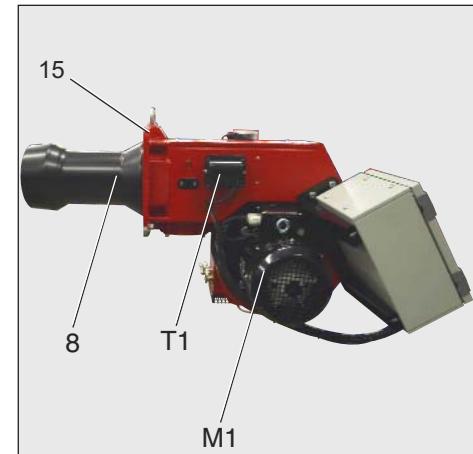

The burner is delivered in a modular system of packagings i.e. separate set/box:

**BBCH**: Burner Body with Combustion Head with flange.

- 1 bag including :- multilanguage technical manual.
- spanner.
- screws, nuts and washer.

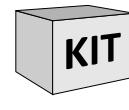

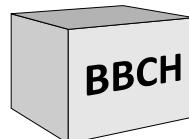

**GT**: separate Gas Train

**KIT & ACS** are managed and delivered separately

- |     |                                   |
|-----|-----------------------------------|
| A1  | Etamatic S control unit           |
| F6  | Air pressure switch               |
| F7  | Gas pressure switch               |

| 15  | Burner flange                     |
| 113 | Air intake                        |

**KIT & ACS delivered separately**

## Function - General safety functions

### Description of functions

When the system is switched on for the first time, after a power failure or safety shutdown, after a lack of gas or after the system has been out of operation for 24 hours, the pre-ventilation period begins.

### During pre-purge period:

- blower pressure is monitored
- the combustion chamber is monitored for flame signals.

### At the end of the pre-purge period:

- ignition is switched on.
- main and safety valve are opened.
- burner starts.

### Monitoring

The flame is monitored by UV cell.

and the gas valve will close.

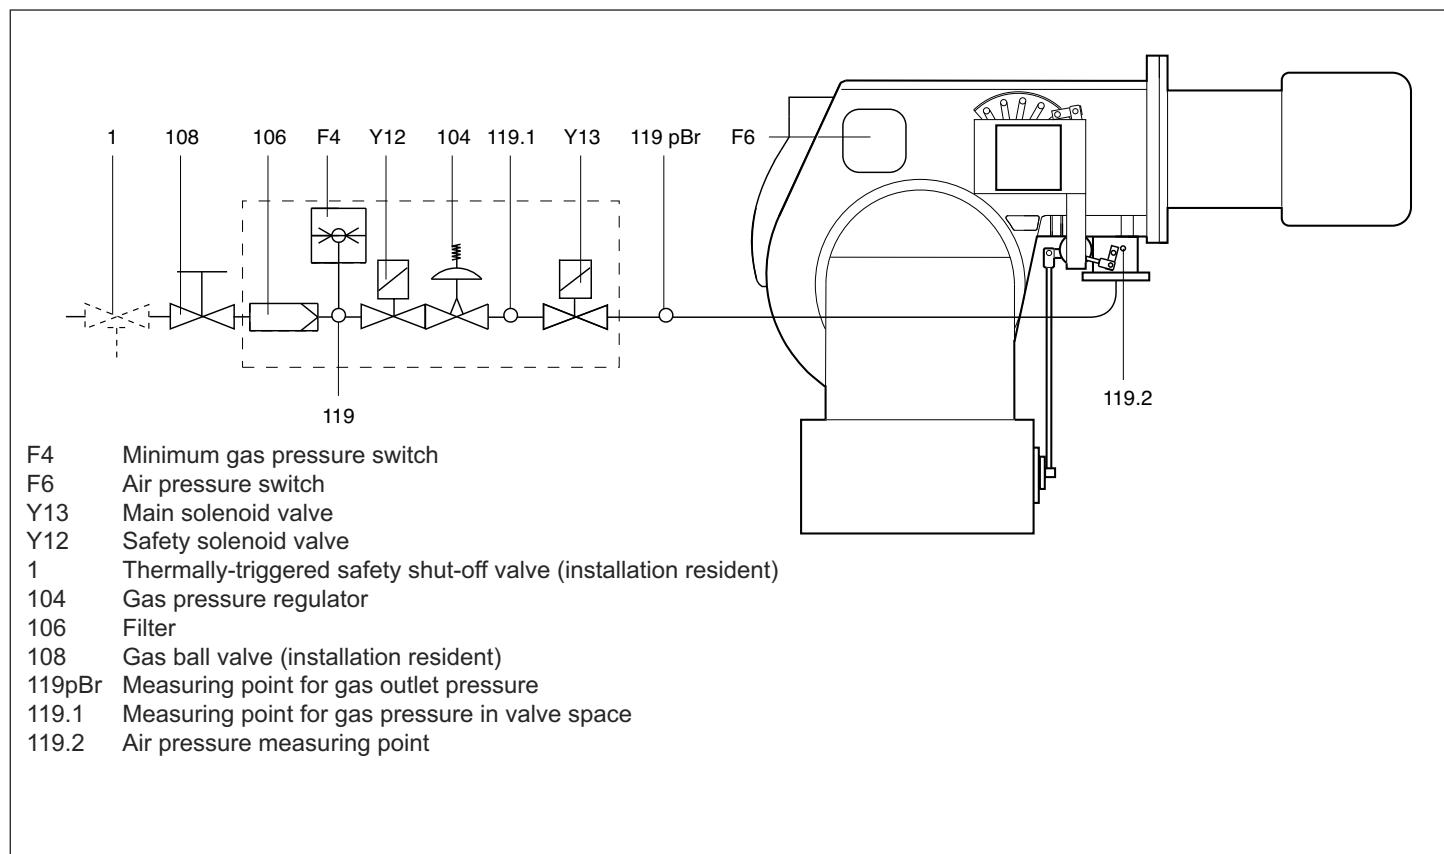

- If the flame goes out during operation, the gas supply is interrupted within one second. A restart takes place. Once the burner starts, operation is continued. Otherwise, a safety lock-out occurs.
- If there is a lack of air during reventilation or operation, a safety lock-out occurs.
- If there is a lack of gas, the burner does not begin operation or switches off.

### In the event of controller shutdown

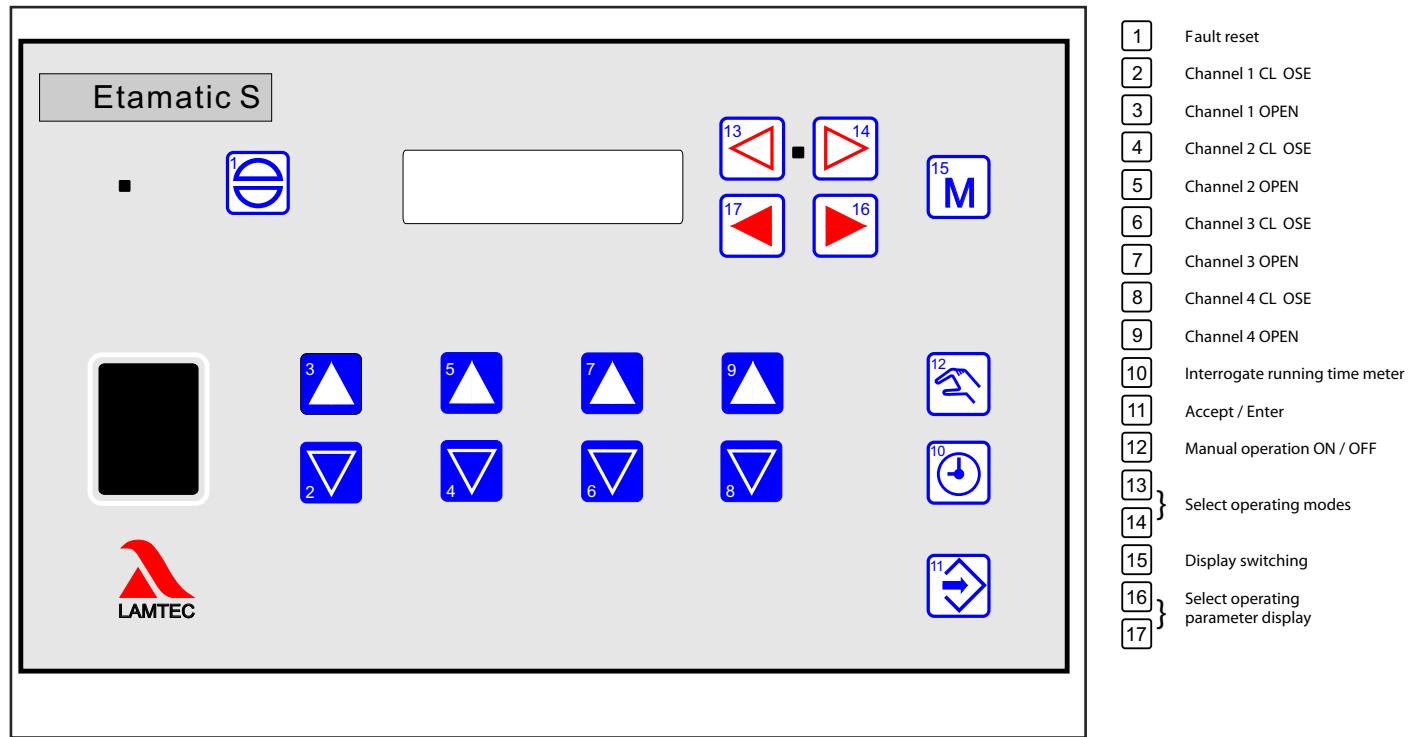

- Controller thermostat interrupts heat request.
- Gas solenoid valves close.
- Flame goes out.
- Burner motor switches off.
- Burner is ready for operation.

### Safety functions

- If no flame is produced when the burner is started (gas release), the burner will be switched off at the end of the safety period, lasting no more than 3 seconds,

## Function - Lamtec Etamatic S control and safety unit

The control and safety unit Etamatic S controls and monitors the forced draught burner. The microprocessor-controlled program sequence ensures the maximum consistency of the cycle times involved, regardless of fluctuations in the mains voltage or ambient temperature. The control and safety unit is designed to detect power failures. Depending on the parameter assignment, the unit either switches to malfunction mode or goes into the standby position if the power supply falls below the mains voltage. In the standby position, there is an automatic restart as soon as the set threshold value is exceeded by 105%.

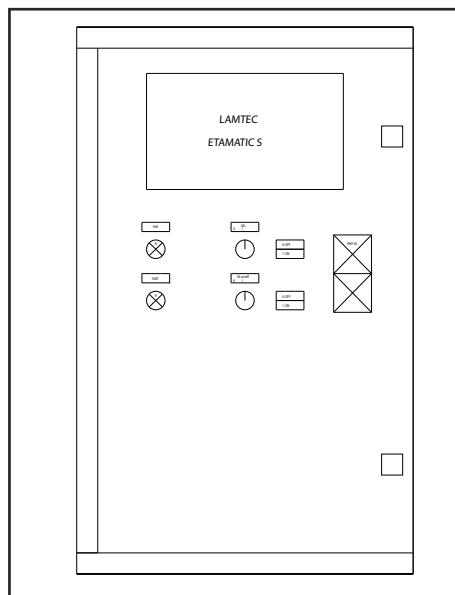

### Manual locking and unlocking

Using the reset button 1, the control and safety unit can be locked manually (interlocked) or unlocked, provided the unit is connected to the mains power supply. This function must not be confused with automatic locking and fault acknowledgement in case of an error.

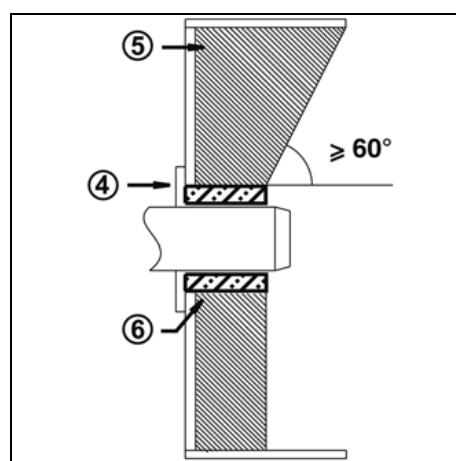

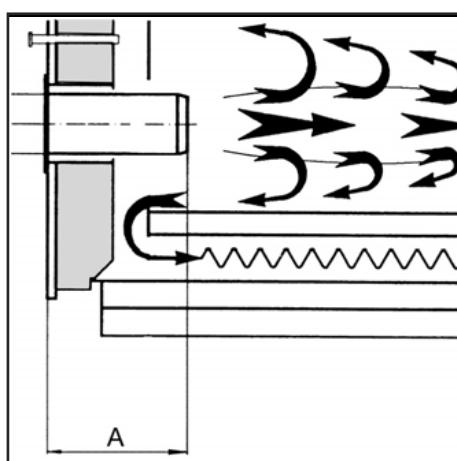

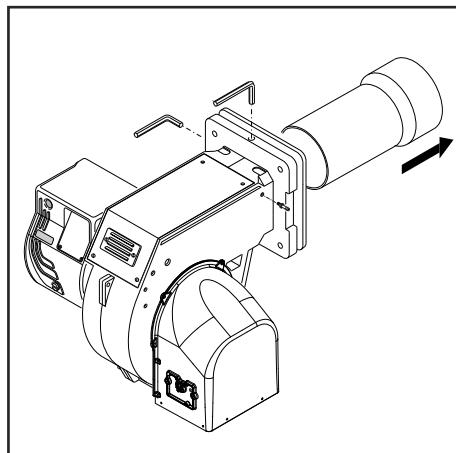

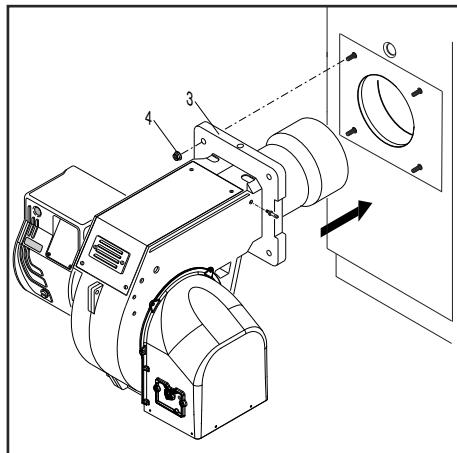

Always switch off the power supply before installing or removing the control unit. Do not attempt to open or carry out repairs on the control unit.

## Function - Control panel

SAL	main switch I/O
SA on /off	burner switch on-off
HLB	lock-out lamp
HLBT	thermal lock-out lamp

## Installation - Burner assembly

### Gas lines

When installing the gas lines and gas train, the general EN676 directives and guidelines must be observed.

EN676 compulsory kit and accessories in order to comply to the safety regulations. Additional accessories and kits shall be installed by the installer in accordance to the local safety regulations and codes of practise.

### General regulations applying to the gas connection

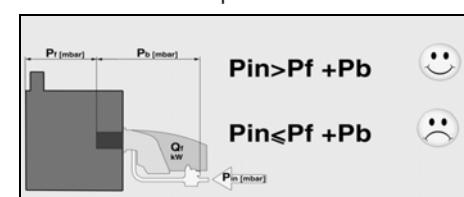

- The gas train must only be connected to the gas mains by a recognised specialist.
- The cross-section of the gas line should be of a size designed to guarantee that the gas flow pressure does not drop below the specified level.
- A manual shut-off valve (not supplied) must be fitted upstream of the gas train.

### LEGENDA

Pf: Back pressure of furnace

Pb: Pressure of burner (combustion head + complete gas train)

Pin: Minimum inlet pressure

### Burner assembly

The burner is fixed to the boiler.

#### Installation:

- fix the flange 3 to the boiler with the screws 4

#### Removal:

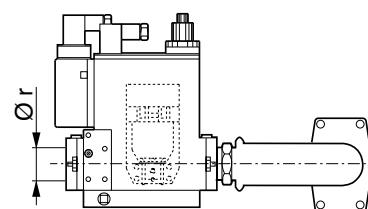

- loosen the screws and remove the burner.

### Burner blast tube insertion depth and brickwork

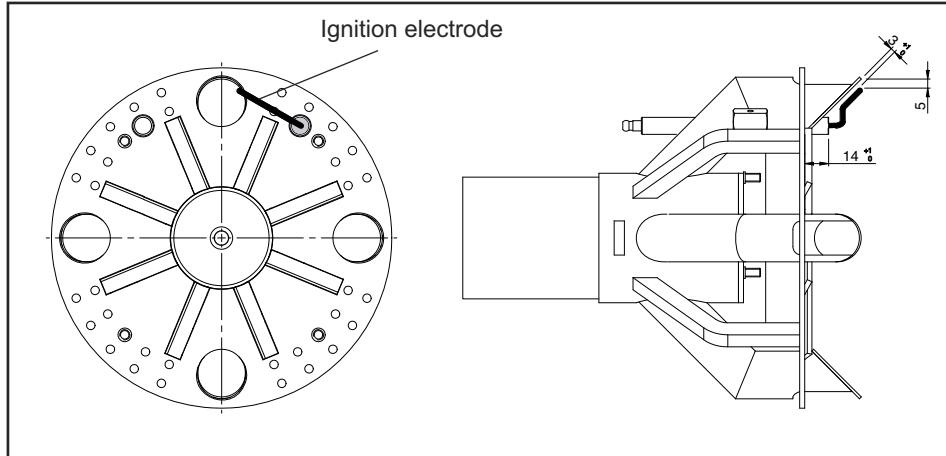

Unless otherwise specified by the boiler manufacturer, heat generators without a cooled front wall require brickwork or insulation 5 as shown in the illustration. The brickwork must not protrude beyond the leading edge of the blast tube, and should have a minimum conical angle of 60°. Gap 6 must be filled with an elastic, non-combustible insulation material. For boilers with reverse firing, the minimum burner tube insertion depth A as specified in the boiler manufacturer's instructions must be observed.

### Exhaust system

To avoid unfavourable noise emissions, right-angled connectors should not be used on the flue gas side of the boiler.

## **Installation - Electrical connection - Checks before commissioning**

#### **Electrical connection**

The electrical installation and connection work must only be carried out by an authorised electrical specialist.

All applicable rules and regulations must be observed.

The electrical installation should include a type A circuit breaker.

**The applicable guidelines and directives must be observed, as well as the electrical circuit diagram supplied with the burner!**

- Check to ensure that the power supply voltage is as specified in the electric diagram and in data plate.
  - Burner fuse: 5 A.

#### **Electrical connection (plug-in)**

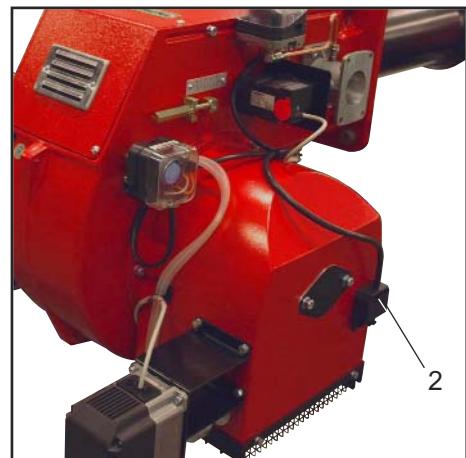

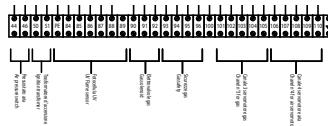

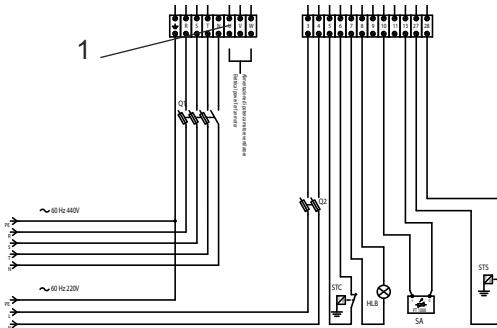

**Electrical connection (fig.1).**  
It must be possible to disconnect the burner from the mains using an omnipolar shutdown device complying with the standards in force. The burner and heat generator (boiler) are connected to the terminal block of the cabinet (fig.1).

## Connecting the gas train

Connect the gas train to the plugs on the burner (fig.2).

The burners are produced with connections suitable for power supply 440 V three-phase.

The burners with electric motors of an output lower or equal to 7.5 kW can be

## Position of electrodes

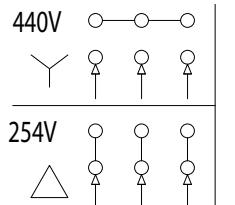

#### **Setting the ionisation probe and**

ignition electrode: see diagram  
Always check the position of the electrodes after service or substitution or assembly of LPG kit as wrong position might cause ignition problem.

## **Checks before commissioning**

**Check before commissioning**

- That the burner is assembled in accordance with the instructions given here.
  - That the burner is pre-set in accordance with the values in the adjustment table.
  - Setting the combustion components.
  - The heat generator must be ready for operation, and the operating regulations for the heat generator must be observed.
  - All electrical connections must be correct.
  - The heat generator and heating system must be filled with water and the circulating pumps must be in operation.
  - The thermostats, pressure regulator, low water detectors and any other safety or limiting devices that might be fitted must be connected and operational.
  - The exhaust gas duct must be unobstructed and the secondary air system, if available, must be operational.
  - An adequate supply of fresh air must be guaranteed.
  - The heat request must be available.
  - Sufficient gas pressure must be available.
  - The fuel supply lines must be assembled correctly, checked for leaks and bled.
  - A standard-compliant measuring point must be available, the exhaust gas duct up to the measuring point must be free of leaks to prevent anomalies in the measurement results.

## Start up - Adjusting burner output

### Adjusting the maximum air flow rate

Air and Gas adjustment are accomplished through Etamatic S parameters setting. Refer to Etamatic S manual attached.

### Adjusting the minimum capacity of the burner

Air and Gas adjustment are accomplished through Etamatic S parameters setting. Refer to Etamatic S manual attached.

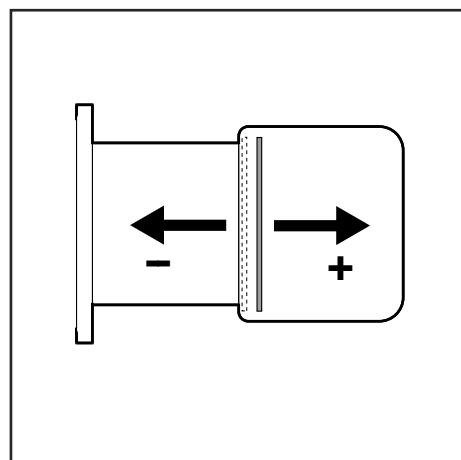

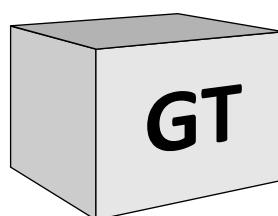

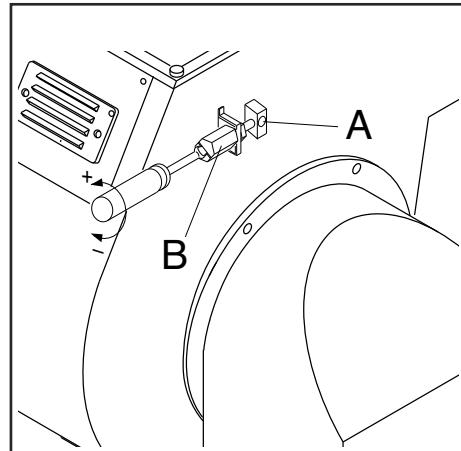

### Adjusting the intermediate capacity of the burner

Gas adjustment is accomplished through Etamatic S parameters setting. Refer to Etamatic S manual attached.

### Firing head setting

The firing head position adjustment is made in order to obtain the best combustion efficiency. When used with minimum outputs the firing head is adjusted in rear position. With high output, the firing head is adjusted in forward position. Adjustment:

- loosen screw A through a suitable Allen key.
- by a screwdriver act on the hex. head screw B until is reached the desired position.
- tighten screw A.

Risk of air blast!

Continuously check CO, CO<sub>2</sub> and soot emissions when adjusting the output of the burner. Optimise combustion values in the event of CO formation. CO must not exceed 50 ppm.

## Start up - Air pressure switch adjustment - Setting gas pressostat

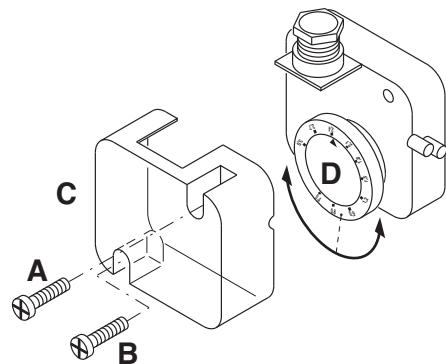

### Air pressure switch calibration

The air pressure switch is provided for monitoring the pressure of the combustion air fan.

Unscrew screws A and B and remove cover C.

After the air and gas setting you have to calibrate the air switch with the burner working on the low flame by slowly turning the relative knob clockwise until the burner locks out. Read the value and then decrease it by 15%.

**WARNING:** the air pressure switch shall prevent the air pressure to go below 85% from the adjustment value in order to prevent the CO in the fumes to exceed 1% (10000 ppm).

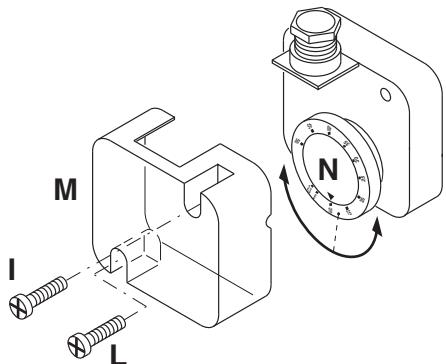

### Min gas pressure switch

The gas pressure switch has the function to check that the gas pressure before the gas valve does have the minimum pressure to make the burner running correctly.

Unscrew off and remove cover M.

- Set knob N to a value equal to 60% of gas nominal feed pressure (i.e. for natural gas nom. pressure = 20 mbar, set knob to a value of 12 mbar; for LPG nom. pressure of G30/G31- 30/37 mbar, set knob to a value of 18 mbar). Screw up cover M.

### Operating check

Flame monitoring must be checked for safety as part of initial commissioning and also after servicing or if the system has been out of operation for any significant period of time.

- Start attempt with gas ball valve closed: the automatic combustion control unit must switch to gas shortage or malfunction after the end of the safety period.

## Service - Maintenance

**Burner and boiler servicing must only be carried out by qualified personnel. The system operator is advised to take out a service contract to guarantee regular servicing.**

temperature is more than 30°C above the value measured at the time of commissioning.

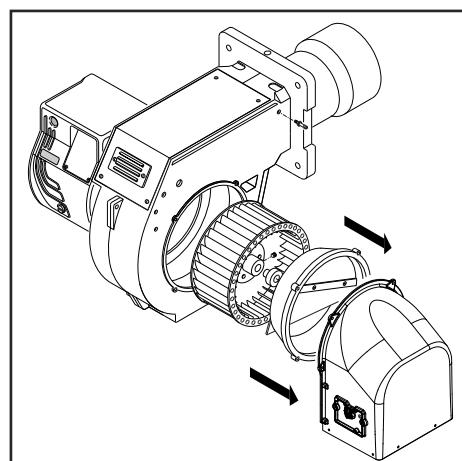

- To simplify the check, use a flue gas temperature indicator.

### Attention

- Disconnect the electrical supply before carrying out any maintenance or cleaning work.
- The blast tube and firing head may be hot.

### Checking the exhaust gas temperature

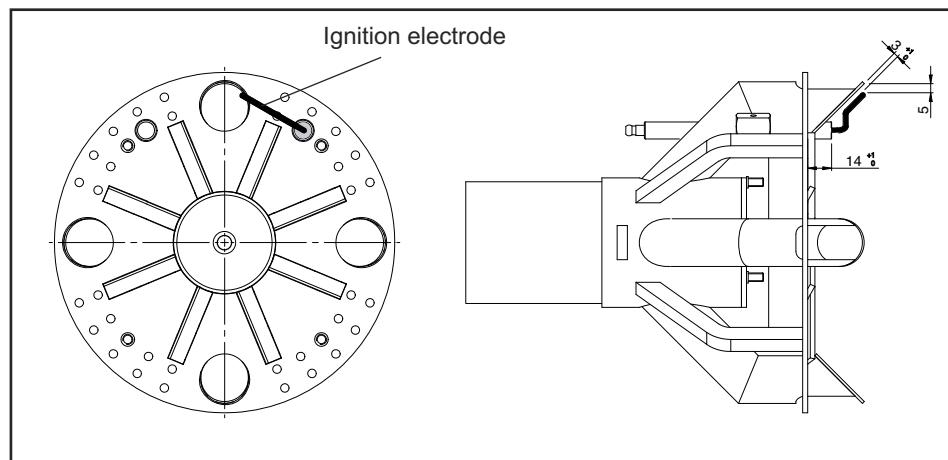

- Check the flue gas temperature at regular intervals.
- Clean the boiler if the flue gas

### Maintenance on the burner

- Check gas supply components (tubes, lines) and their connections for leaks or signs of wear, replace if necessary.
- Check electrical connections and connection cables for damage, replace if necessary.
- Check gas filter, clean or replace as necessary.
- Clean fan wheel and housing and check for damage.
- Check and clean the mixing unit.
- Check ignition electrodes block, readjust or replace as necessary.
- Start burner, check flue gas data, correct burner settings if necessary.

- Check the setting for air pressure switch and gas pressostat.
- Check the gas train settings.
- Carry out an operating check.

## Service - Troubleshooting

### Fault diagnosis and repair

In the event of a malfunction, first check that the prerequisites for correct operation are fulfilled:

1. Is the system connected to the power supply?
2. Is there any gas pressure?
3. Is the gas shut-off valve open?
4. Are all control and safety devices, such as the boiler thermostat, low

water level detector, limit switch, etc. adjusted correctly?

If the malfunction persists, use the following table.

It is not permitted to repair any components relevant to safety. These components must be replaced by parts with the same order number.

### Only use original spare parts.

#### NB: after each operation:

- under normal operating conditions (doors closed, hood fitted, etc.), check combustion and check the individual lines for leaks.
- Record the results in the relevant documents.

### Maintenance

#### Annual check

The burner (combustion head, electrodes, etc.) must be checked regularly by an authorized technician, once or twice a year, depending on how much it is used. Before proceeding with the maintenance check-up on the burner, it is advisable to check the general condition of the burner and take the following steps:

- Disconnect the burner (remove the plug).
- Close the gas shut-off cock.
  - Remove the cover from the burner, clean the fan and air intake.
  - Clean the combustion head and check the position of the electrodes.
  - Re-install the parts.
  - Check the seal on the gas connectors.
  - Check the state of the flue.
  - Start the burner.
  - Check the combustion parameters

#### Before taking any action check:

- That there is power in the circuit and the burner is connected;
- That the gas pressure is right and the gas shut-off cock is open;
- That the control systems are properly connected. If all these conditions have been satisfied, start the burner by pressing the reset button.
- Check the burner cycle.

#### If the burner fails to start:

check the switch, the thermostats, the

motor and the gas pressure.

#### If the burner proceeds with preventivation but cuts out at the end of the cycle:

- Check the air pressure and the fan.
- Check the air pressure switch.

#### If the burner proceeds with preventivation but does not light:

- Check the installation and position of the electrodes.
- Check the ignition cable.
- Check the ignition transformer.
- Check the safety device.

#### If the burner lights but cuts out after the safety interval:

- Check that the phase and neutral wires are connected correctly.
- Check the gas solenoid valve.
- Check the position and connection of the UV cell.
- Check the UV cell. Check the safety device.

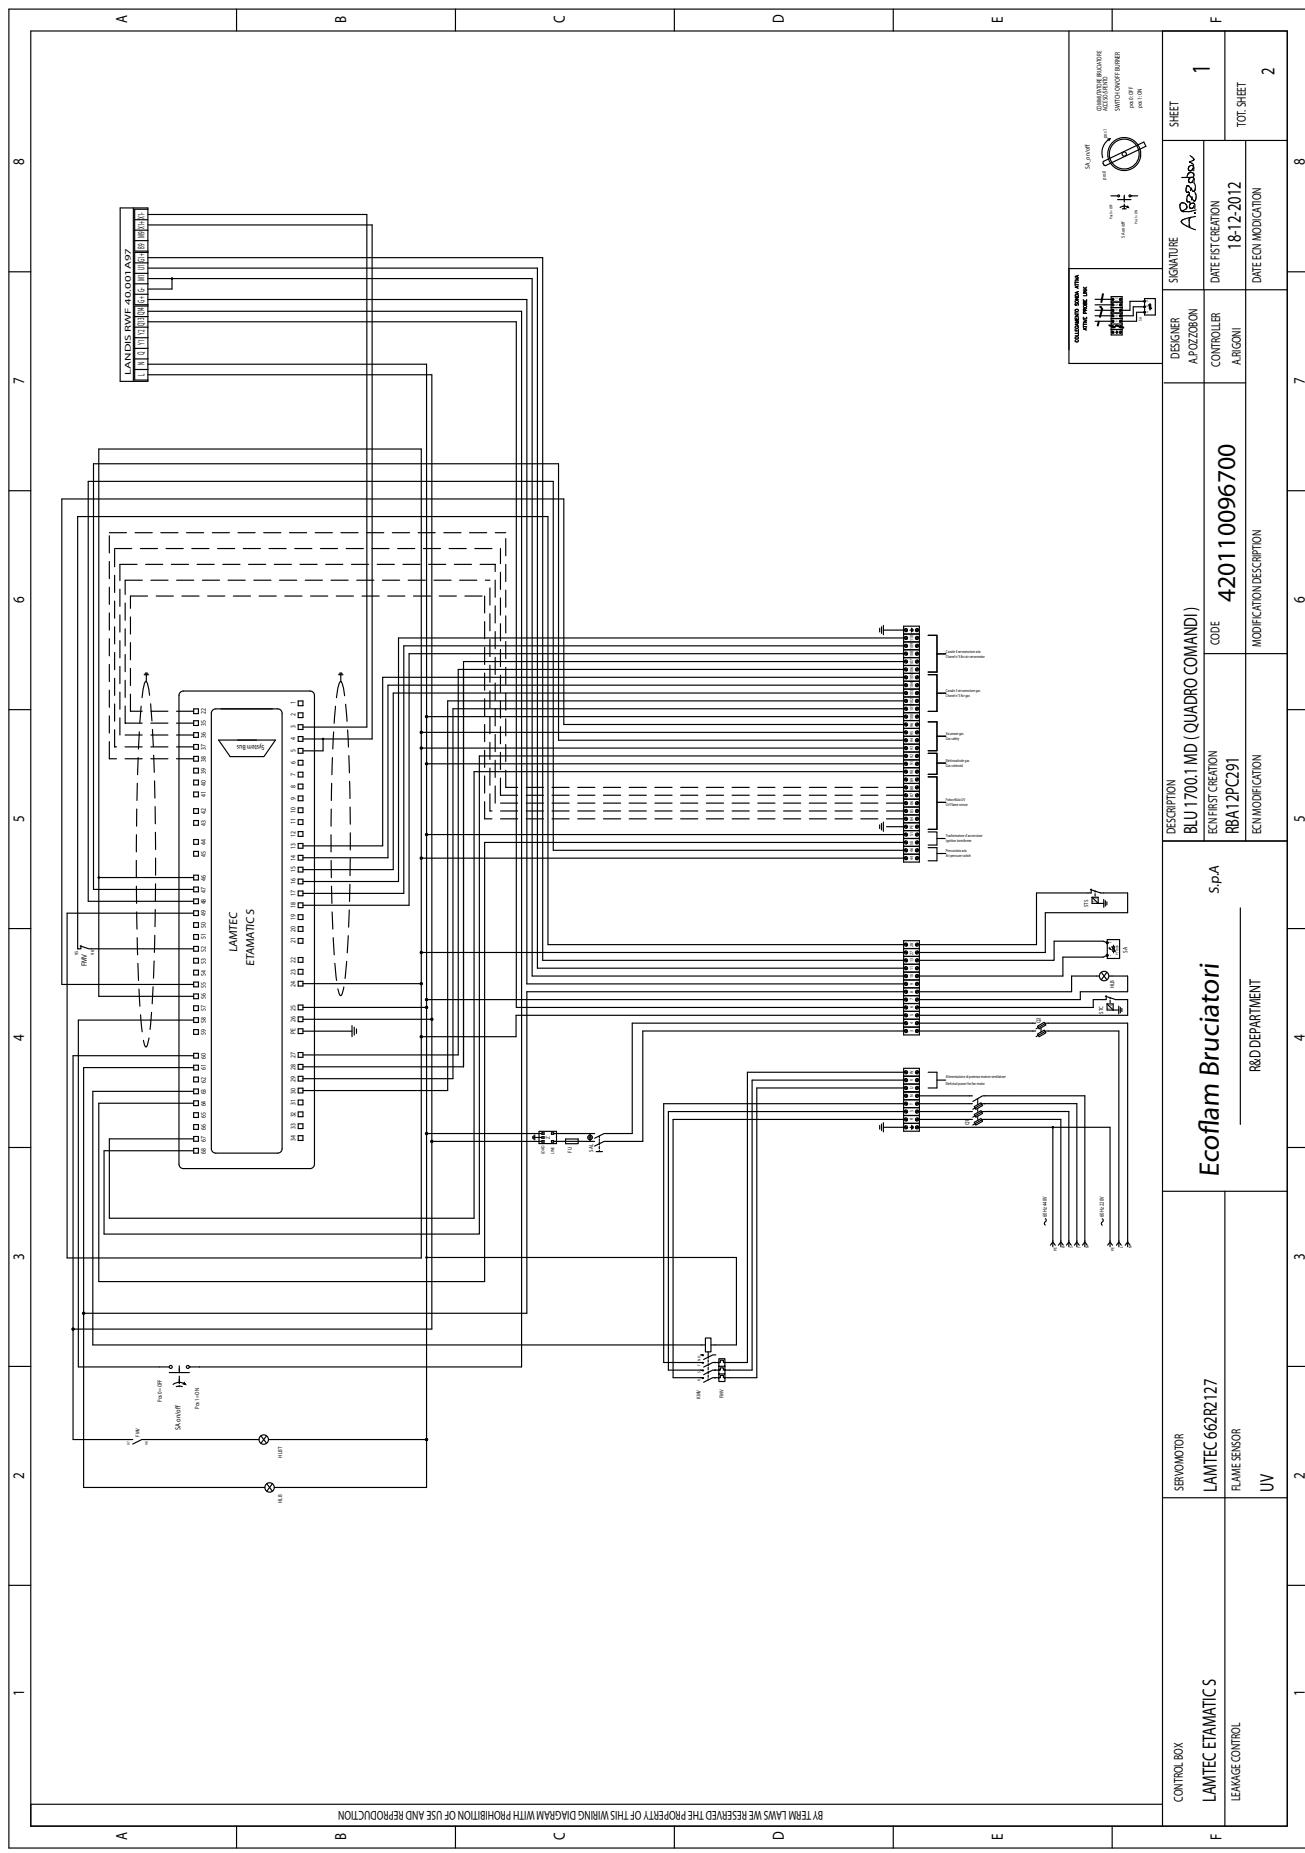

#### If the burner lights but cuts out after operating for a few minutes:

- Check the pressure regulator and gas filter.
- Check the gas pressure with a pressure gauge.
- Check the detector value.
