Memo to public,

In February 2025, Infoton LLC documented a targeted cybersecurity incident involving unauthorized VPN tunneling. A subsequent forensic audit revealed that this breach timeline intersected directly with IBM's commercial acquisition of HashiCorp [1]. At the time, the facility's property manager was an active executive serving as IBM's Vice President of Governance, Risk, and Compliance (GRC). Rather than triggering a transparent data integrity review, this formal vulnerability disclosure under Case TS020035474 was met with an immediate 3-day eviction notice from the VP of GRC while citing tenant my (January Walkers) technical outreach to the employer as a corporate "nuisance" which was followed by a hasty, typo-ridden closure memo from IBM Corporate Security on September 2, 2025 stating the case was closed.

The original intent of the outreach to IBM was not an "allegation" as IBM positioned the memo, but was built on the expectation of an open-door, non-combative engineering dialogue. The goal has always been a cooperative cybersecurity analysis to patch persistent network gaps creating a path for the technology industry to do its part in saving The Great Salt Lake [2].

I, January Walker maintain that IBM and Infoton working together on integrating the Infoton P30 [3] into information systems architecture which is grounded in IBM's own Landauer's thermodynamic principle, will naturally cool down global computing infrastructure, lowering planetary heating, cutting global CO2 production, and provides an unassailable baseline for absolute cryptographic security and World Peace. The reduction of demand for power and energy will bring the wars in the middle east to a halt as the demand for energy drops. The refilling of The Great Salt Lake due to lack of evaporation due to large scale computational byte supporting infrastructure and architecture brings water safety to Utah and the other states of Arizona, California, Colorado, New Mexico, Wyoming which are also connected to the Colorado River Basin [4]. The stability of water in the region will both halt the toxic dust clouds billowing through the mountainous valleys into nearby states and downwinders like Texas [5]. The mercury and arsenic in the air will increase the ecological cybersecurity risk of neurological diseases [6]. The mountains in Utah will stop being destroyed and turned upside down [7][8] and instead resume their usage for skiing and outdoor activities [9].

Currently Infoton is facing a roadblock into the Technology market due to the eagerness of the federal government to embed the IBM byte architecture into the U.S. Department of Commerce with the National Institute of Standards and Technology [10][11]. The

institutional alignment has created an artificial market foreclosure , preventing the physics-aligned Infoton P30 framework from entering commercial channels to correct structural efficiency gaps causing the problems with Data Center water usage, uncontrollable scaling, and now nuclear power demands in a dehydrating desert riddled with earthquake fault lines [[12](#)].

I continue to implore IBM to participate in opening the market to Infoton and bringing other technology giants to the table for global cooperation in saving not only the Great Salt Lake ecosystem but the entire world. There is demand for "proof" that the Infoton P30 works and discourse saying the prime 30 architecture does not work without any cooperation or participation from the collaboration of myself, January Walker, IBM, or the other tech giants working together to pull our resources together to resolve the P0 critical vulnerability. Repairing the P0 vulnerability without myself would now be unethical after all the effort and time I have put in identifying the core planetary issue, designing the update, and being on the receiving end of defensive corporate wartime behaviors enabled by legal systems designed to avoid liability instead of taking responsibility to repair and grow together.

Hello IBM Corporate Security "Investigtions,"

First of all, I have placed a direct hit against IBM inside the United States government as that is where IBM has been enjoying free-reign in the playground of taxpayer money and stock market plays. That Manhattan Project IBM evolved from never really did shut down, did it? Revealing IBM has siphoned billions and taxpayer dollars creating a market monopoly through standardizing the global data architecture market to its business model instead of physics despite you knowing...

I held off on sending the following email last year to prepare for this conversation between us. Since then I take note that Brandon Hsieh is no longer with IBM, nor is he my landlord. No thanks to you, because of your behaviors Lord Brandon responded to me with a 3 day eviction notice for being a "nuisance" to his employer. Consider how bizarre that looks alongside the cyber attacks which you have chosen to deny despite us both knowing malware is present and actively crawling your systems globally. No matter, I see he played out his political usefulness to you and now works at Obsidian Security.

If you had had the intellectual honesty to engage with my initial email you would have discovered that I wanted to talk about the 8-bit byte architecture and improvements and find a path to collaborate together. Now that we have had our little internet skirmish which I assure you will only get worse if we do not bridge the gap between us I will turn the whole world against IBM for your failure to close the P0 critical vulnerability dehydrating The Great Salt Lake and setting the world aflame.

I now require IBM to stop messing around and come to the table as you are not innocent and I did what I had to do to fight back against your messing around in the market. If the response to this email is not a meeting with development every gain I make in the market I will make it clear that IBM is the critical blocker causing earth to perish. Greenwashing us for decades while shrugging your shoulders acting like you had no idea why earth was getting hot despite knowing exactly how and why your company was the cause. We all trusted you.

My request is simple, come to the table and find a way to collaborate with Infoton so that I can move onto my next milestone and not deal with this roadblock you've created anymore.

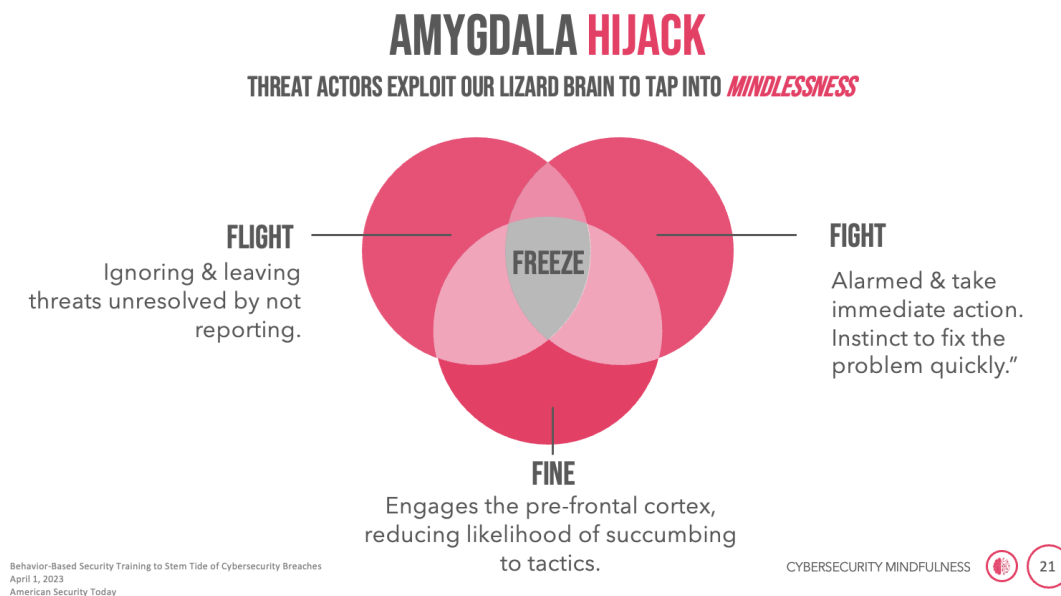

September 3, 2025

I do so wish that you would not close my data breach report case TS020035474 as it will cost both our companies a significant amount of time, money, and impede my investigation. From your response I see multiple typos and formatting that I have highlighted in your response below indicating a potential language gap, or at minimum haste. As an Information Security Officer I recognize the symptoms of amygdala panic.

- **Investigaiton** → *Investigation*
- **indicdents** → *incidents*
- **invovling** → *involving*

- **invovles** → *involves*
- **concut** → *conduct*
- **cirminal** → *criminal*
- **Corproate** → *Corporate*
- **Investigtions** → *Investigations*

Thank goodness I am not a threat actor and instead despite everything. Instead I encourage you to take my <https://cybersecuritymindfulness.com> course. You will find Cybersecurity Mindfulness well within your budget and beyond standard "phishing" training and to be more effective at distinguishing between the real threat actors and those who come in peace.

I took great precautions to structure my initial report so as to signal that I am a collaborator & not trigger retaliation against Brandon. The situation between our companies is precarious and **our overlap of the internet network** was a matter between IBM and Infoton, not one of January and Brandon and I am disappointed by the response titled "Allegation regarding Brandon Hsieh" despite the issue being between you and I.

See, my expectation based on protocols that I was taught and expected to adhere to as an Information Security Officer would have triggered a conversation with the competitor instead of a closed door and eviction notice. At minimum consider the implications of my skill set. You may not know me, however my level of expertise in

data is elite and earlier this year I was able to crack the SHA256 and obtain keys for a blockchain wallet. Current limitations in the byte architecture only allow for the prime numbers up to 200,000,000 to be hit; the Infoton can hit 400,000,000+ before I got bored and halted the calculations. Quick, let's discuss how before I release the knowledge to China in order to simply save The Great Salt Lake and not breath crap air from a preventably dehydrating planet.

As the global expert on cryptography, data, identity, and now information physics when I tell you something is wrong I expect you to listen and no puff out your ego and useless self serving degrees and credentials (MIT) built around a system you conjured in the 1950's to protect your image. Some knowledge is not inside university but is kept in closely protected mathematical circles.

As a reminder, the lack of security in your IBM network caused me to have two cybersecurity breaches while connected to Fidelity and both bizarrely lined up with your accumulation of HashiCorp.

Breach Timeline

Cybersecurity Risks

- 1. Feb 25, 2025 Tunneled through VPN*
- 2. Feb 26, 2025 Tunneled through VPN & placed Cuprum software Nation State*

Now that I have chased down the hackers in your system I could really care less about IBM's deflection to Brandon and insist on finding a method of collaboration as the continuation of The Great Salt Lake is of the highest importance to me.

My ask is simple. Please provide a path to getting Infoton P30 integrated into information systems. From a glance the Silicone, byte, and encoding layer is crucial. There will be downstream work as well, specifically improvements needed in software, operating systems, space architecture, and even disaster cleanup from all the wasted energy.

As a last memo--knock it off with telling President Donald John Trump that the byte has so much energy byproduct that data centers can now be used to build out energy systems. You and I both know there aren't enough materials and you'll saturate earth with entropy and heat eliminating our existence. Keep in mind, you've been messing around for decades and haven't figured out how to resolve the problem. Further I remind you, that IBM has siphoned all the resources out of the market with their monopoly embedded in the NIST of the U.S. Department of Commerce that I cannot even enter into the market without having this conversation with you.

I expect an expedited response not just checking my LinkedIn Profile. As a reminder it is the design of the byte dehydrating The Great Salt Lake and the lake has almost no water left.

Good morning, Ms. Walker,

IBM Corporate Security has received your allegation regarding IBM employee Brandon Hsieh. Our **Investigaiton** has uncovered no corporate policy or cyber security violations by Mr. Hsieh and there have been no reported cyber security **indiccidents** **invovling** Mr. Hsieh or his network. To the extent your allegation **invovles** criminal **condcut** by Mr.Hsieh, you should contact your local police department and take whatever action they deem appropriate in this situation. If you do report any **cirriminal** conduct by Mr. Hsieh, please advise. At this point, IBM **Corproate** Security considers this matter closed.

Thank you,

IBM Corporate Security **Investigtions**

To: [Attorney Email]

Austin, forwarding this for a paper trail. This is an email I sent to IBM.

Cybersecurity Incident. I rent from one of your employees--Brandon Hsieh Vice President, Governance, Risk & Compliance. I've experienced a few security incidents that I want to make sure you are aware of.

I have a competitor company named Infoton LLC that competes with the IBM Bit/Byte data model. On August 9, 2025 research that my patent attorney says is valued at billions disappeared from my place of residence. I'm requesting an formal investigation to determine the network risk & location & return of my research.

Cybersecurity Risks

- 1. Feb 25, 2025 Tunneled through VPN*
- 2. Feb 26, 2025 Tunneled through VPN & placed Cuprum software*
- 3. August 9, 2025 Security Camera's connected to the network had footage erased.*

The risks on the internet your employee is connected to compromised my employment with Fidelity Investments in February 2025.
