

Protect your investment in standby power generation

What interferes with normal operation of a Generac system? The most common issue is airflow obstruction to the unit when it's producing power, caused by:

- Tree leaves
- Blowing sand and dirt
- Snow
- Flood waters.

Each of these hazards can require costly maintenance to mitigate. The solution is simple. *Raise the unit above the ground enough to eliminate the threats.*

Introducing the Viegor **Everest** platform for Generac customers.

The Viegor Everest minimizes maintenance expense.

Robust, rust-free aluminum construction, assembles in minutes

By elevating your Generac unit above the ground, you ensure that the critical hydro standby system is always ready to deliver without interference. Count on your Generac dealer to recommend this accessory.
