

EQU StreamZ FETLOCKBANDS

STREAMZ FOR HORSES

Providing pain relief for horses EQU StreamZ fetlock bands were developed in the UK.

They provide a natural response to a variety of symptoms found with horses and are a new technique of magnetic therapy to the equine market. Unlike traditional magnets StreamZ creates no heat allowing them to be left on for long periods of time and creating a non-invasive form of therapy.

Each pack contains two fetlock bands to be worn by one horse; comfortably wrapped around the cannon or pastern bone on either front or hind legs and worn for a minimum of 8 hours per day. Designed to fit all breeds and to support issues with mobility (arthritis), inflammation, tendon/ligament injuries, energy levels, recovery process, general wellbeing, and can be used in conjunction with other therapies. StreamZ produces no heat and is suitable for 24/7 use including turn out times.

360° MAGNETIC HORSE BANDS

Traditional magnets have been used for many years to treat a variety of symptoms, often being found in boots or rugs. Disadvantages in using more traditional methods include the inability to leave them on for long periods of time due to the heat created by each pulsating magnet and how they only effect local areas.

StreamZ non-invasive magnetic horse bands introduce a new technique in how magnetism is deployed – 360° resonance technology, rebalancing the whole body. Each EQU StreamZ magnetic horse band contains a continuous strip of StreamZ material, creating a 360° low-frequency energy field around the horses leg.

StreamZ does not pulse, it spins! This unique process prevents an increase in temperature allowing the bands to be left on for long periods of time, improving their impact whilst reducing ongoing management time.

EQU StreamZ **FETLOCKBANDS**

IMPORTANT INFORMATION: Each horse must wear two EQU StreamZ bands just above or below the fetlock area. They are designed to be worn for a minimum of 8 hours a day although results have been reported as significantly greater when used 24/7. Waterproof and designed to be used in most weather conditions however “24/7 use” refers to the technology and does not indicate the bands can be left on in all weather conditions or whilst out hacking. The bands are developed to be used in recovery, not whilst in active use. When the ground is soft and the horse is turned out the bands should be placed above the fetlock joint and out of the soft ground. Care and attention and a level of common-sense is required for the bands to last; as with any other tack product. See care details.

StreamZ offer a complementary form of treatment and should not to be used as a replacement to any professionally diagnosed medications or treatments. StreamZ technology is not clinically proven as the clinical studies carried out were not peer reviewed.

StreamZ bands can be used in conjunction with medications, supplements, diets, and traditional magnetic products however it is advisable that traditional magnetic products are not placed over the top of StreamZ as this can create damage to the StreamZ 360° magnetic energy field, either when on the horse or when in the tack room.

MEDICAL CONDITIONS TO BE AWARE OF: Please note that as with mainstream medications, StreamZ do not offer a guarantee on the intended results. It is advised the EQU StreamZ should not be used on any horse diagnosed with a medical heart condition. Seek professional medical advice prior to use.

Some white-haired horses may find the neoprene too sensitive to place against the skin; if this is a known issue then a few layers of vet wrap/bandage can be placed around the leg before the bands are fitted.

Less than a handful of customers have reported an adverse reaction to using the bands when treating a horse diagnosed with severe Cushings Disease (PPID). How each horse is treated depends on which clinical signs that particular animal has and how severe those symptoms are. In many cases the advice by professionals is to manage the clinical signs, such as laminitis, secondary infections and excessive hair growth. This is achieved by modifying the animals' diet and supplements to help support the natural healing process. The 'adverse reaction' reported is thought to relate to this process. As the natural healing process begins to improve the animal can occasionally indicate a negative reaction before showing signs of improvement. In the few negative reports we have received it was reported that the horses showed signs of filling and a reduction in mobility. This contradicts many other reports from similar users, however, as a company with a focus on animal welfare we deem it important to share this feedback. Please consult your veterinary professional if you require medical advice and review our returns process, or contact one of our team.

IMPORTANT CARE DETAILS: StreamZ advertise the EQU bands as “24/7 use”. This refers to the technology being able to be worn all day every day, and particularly when the horse is 'in recovery'. This does not stipulate that bands can be worn 24/7 in all weather conditions, particularly in the UK. Common sense is required as to when the horse can and cannot wear the bands.

Cleaning the bands: The material has a life span as with any aesthetic product such as shoes or clothing; it requires care and attention to last 12 months or more, particularly the fastening. To keep the bands as long as possible it is advised that they are washed every couple of weeks. Simply remove the StreamZ silicone strips from the open end of the bands (the end next to fastening tongue) and wash in a machine under 40°C or on hand washing setting and place the strips somewhere safe. Hand/pat dry and slide the StreamZ strips back into the bands, with the ridges/lines on the StreamZ strip facing away from the skin (smooth side facing the skin).

The fastening within the EQU StreamZ requires a level of maintenance and care. Warranty is available on defects with the fastening. Proof of purchase will be required for warranty defects; damaged or lost bands are not covered under warranty.

WHERE AND WHEN TO WEAR THE BANDS: The EQU bands are developed to be used as an aid for recovery and not to be used in active work (there is slight movement under the fetlock joint). The EQU bands should be completely removed or worn above the fetlock in soft ground conditions, further still if the ground is soft enough to allow the bands to be submerged then the bands should be removed and only used when turned in. In wet/muddy conditions it is advised to remove them completely to avoid the bands being submerged. Lost bands are not covered under warranty and single bands are not available for purchase.

ABOVE Fetlock – use when turned out in soft ground conditions or whilst in light work.

BELOW Fetlock – use below fetlock when turned in or on box rest. (Slightly better reaction when placed below, but movement is found below the fetlock).

ADVICE: If the horse is 'turned in' we advise that the bands are placed below the fetlock (around the pastern); the artery is slightly closer to the outside of the skin under the fetlock joint. If the horse is 'turned out' then we would advise that the bands are placed above the fetlock joint (around the cannon bone). We recommend that the bands are placed on the near fore and off hind legs, no matter what the injury, although it generally makes little difference. If you have any questions please do not hesitate in emailing our support team; help@streamz-global.com.
