

## IFS Kit Compatibility

The newer style HEUI pump shown below has a short steel jumper tubing from the HEUI pump outlet to the cylinder head port. Once this tubing is removed with a 13/16" wrench the connections of our hose sets are simple to install.

The photo below shows the connection points. Lower hose shown is the HEUI outlet and connects to the filter inlet. The top hose connects to the head port from the filter outlet.

The older style HEUI shown below has variations of the high pressure tubing. However, our research has found the fittings are the same as the newer generation.

The IFS is applicable regardless of your HEUI type.

NO removal of any original components. NO removal of the air compressor like other designs on the market. Lower frame mounting of the IFS makes installation simple and clean.
