AOC USES THE NAWT COLLAR TO HELP PRESERVE OUR NATION'S HERITAGE!

The NAWT Collar has found a prestigious home—at the U.S. Capitol! But no, not that AOC. We're talking about the Architects of the Capitol—the dedicated team of engineers and preservationists who keep the Capitol complex running like a Swiss watch. Their work ensures that our lawmakers operate in a safe, comfortable environment while safeguarding the nation's most treasured architectural and historical features.

The NAWT Collar is now being used in a critical application: the piping and pumping system for a historic fountain on the Capitol grounds. Because the fountain's original fixtures hold significant historical value and cannot be replaced, conventional chlorine treatment is not an option—chlorine would corrode and damage the delicate materials.

Instead, the AOC team uses sodium bromide as a biocide. However, over time, it tends to crystallize inside the pipes and pump, leading to serious maintenance challenges. As crystals form, they restrict water flow, reduce pump efficiency, increase energy usage, and shorten the pump's lifespan. The historic fixtures also become coated with these deposits, requiring labor-intensive mechanical cleaning.

Enter the NAWT Collar. This innovative device generates a wave that disrupts the crystallization process of sodium bromide, keeping the system running smoothly and efficiently.

Even better—the NAWT Collar operates with:

No electricity

No magnets

No chemicals

No maintenance

Eliminate the chemicals, save energy and forget maintenance!!!!!!
