Notes: Most data from SkySafari7Pro smartphone application, 2025.

Angular size=as viewed from Earth; Distance=distance from Earth; Dia=overall true size; (Sep)=distance between double stars;
Mag=apparent visual magnitude from Earth.

min=arcminute; sec=arcsecond; ly=light year (~5.9 trillion miles); kly=ly x1000; Mly=ly x1,000,000.

AU=astronomical unit, 1AU=the average distance from Earth to Sun (=93,000,000 mi).

Earth orbit causes stars to rise approx 4 minutes earlier/day. Planets move differently per orbit. Moon≈45 minutes later/night.

Milky Way: size = 100x2 kly; stars = 100-400 billion. Solar System in MW: 483,000 mph. MW thru space: 1,300,000 mph.
