

WE ARE

NEURODIAGNOSTIC TECHNOLOGISTS

WHAT WE DO

We perform diagnostic testing on a patient's nervous system. This includes electrical brain activity not only from the brain as a whole, but areas of the brain involved with hearing, vision, movement, and sensation.

WHERE WE WORK

Doctors' Offices | Outpatient Clinics | Operating Rooms | Patients' Residences

THESE ARE OUR PATIENTS

We work with both Inpatients and Outpatients affected by ...
Dementia | Stroke | Epilepsy | CJD | Autism | Traumatic Brain Injury

WHY IT MATTERS

The health of a patient's nervous system relies on the expertise of a Neurodiagnostic Technologist when it comes to ensuring the data from the nervous system is recorded correctly. A physician will interpret that data and use it to help in the diagnosis of the patient.

Neurodiagnostic Technologists know what is normal and what is abnormal in brainwave readings and are able to quickly notify the physician. This quick recognition by the technologist and physician notification may prevent irreversible damage to the patient.

**Neurodiagnostics Technologists are the eyes
of the physician during diagnostic testing
of the patient's nervous system.**
