Department of Environmental Services
Biosolids and Septage Distribution and Permit Inventory
Last update August 29, 2022

This report is to educate the public on biosolids generation and distribution within the state of New Hampshire. The Clean Water Act (1972) established the requirement for biosolids management rules titled, 40 CFR part 503 (CWA, sec 405(d)). These rules have been active since 1993. In the state of New Hampshire, Legislation allows for biosolids and septage to be land applied per RSA 485-A:4 and requires New Hampshire Department of Environmental Services (NHDES) to establish rules to govern the management of sludge. In 1999, NHDES established Env-Wq 800: Sludge Management Rules. As well, in 2005, NHDES established Env-Wq 1600: Septage Management Rules. These rule sets have stricter requirements than the federal rules for managing sludge and septage in New Hampshire. Anything omitted from either state rule set is automatically reverted to the federal rules, 40 CFR part 503. Within Env-Wq 800 & 1600, NHDES has established permit programs for the land application and management of sludge or septage.

This inventory covers the permit programs that allow for the distribution and land application of either sludge or septage in NH. The first inventory is on active and inactive Sludge Quality Certificates (SQC). A Sludge Quality Certificate is the certificate a generator of biosolids must obtain to distribute bulk biosolids within the state. It should be noted that some of the inactive SQC holders managed their sludge prior to Env-Wq 800 being established. There are two types of biosolids in the marketplace that are used for land application, Class A & B biosolids. Class B biosolids are treated to significantly reduce pathogens present in the sludge. Class B biosolids can only be land applied at permitted sites that required public notification of the management activities, testing of the site, and site & management plans that need to be always kept up to date. Class A biosolids are treated to further reduce pathogens and do not require a site permit for land application. While there are no site permits required, there are still rules that applied to the management of class A biosolids, and all biosolids managers must follow the UNH Cooperative Extensions Best Management Practices for land application of biosolids.

Any septage that is to be land applied must obtain a site permit from the Residuals Management Section before any activity is to occur. Since septage management has its own rule set, these permits are governed under Env-Wq 1600: Septage Management Rules. All activity within these permits is reported to the Residuals Management Section annually by the permittee. Exceptional Quality Certificates are the approvals for a generator of septage based fertilizer to be distributed in New Hampshire. These approvals do not require site permits for land application, like class B biosolids distribution.

There is an inventory of all approved class A biosolids distribution from 2016 to present. Prior to the 2016 rule revisions, class A biosolids distribution volumes were reported as either in-state or out of state. Therefore, not all Class A biosolids distribution is present within this inventory. Per Env-809.09 (a) (7)(8), 50 cy or more of composted or un-composted class A biosolids must be reported to NHDES per the approved generators annual report.

Any biosolids land applied in New Hampshire prior to 1999 may not be within this inventory report. However, there are some electronic files available of the land application events per generator of the biosolids. These files are available upon request.

If you have any questions about the Residuals Management Section or the rules, please reach out to Anthony Drouin, Supervisor; anthony.f.drouin@des.nh.gov or 603-271-3571

Biosolids and Septage Distribution and Permit Inventory

Last update August 29, 2022

Supporting Definitions:

"Quality-certified sludge (QC sludge)" means sludge or a mixture of sludge that:

- (a) Has received sludge quality certification pursuant to Env-Wq 809 or is a mixture of sludge for which each constituent sludge has received sludge quality certification; and
- (b) Contains nutrients or organic material, or both, that can be used:
 - (1) To improve crop land or forested land; or
 - (2) For reclamation.

"Site" means contiguous land areas owned by the same person(s), on which quality certified sludge is stockpiled for 8 months or less or land applied, even if the land area is divided by a highway, railroad bed, water body, or boundary of a political subdivision.

"Septage" means material removed from septic tanks, cesspools, holding tanks, or other sewage treatment storage units, excluding sewage sludge from public treatment works and industrial waste and any other sludge.

"Sludge" means the solid or semisolid material produced by water and wastewater treatment processes, excluding domestic septage; provided, however, sludge which is disposed of at solid waste facilities permitted by the department shall be considered solid waste and regulated under RSA 149-M.

"Biosolids" means any sludge derived from a sewage wastewater treatment facility that meets the standards for beneficial reuse specified by the department.

"Beneficial use" means taking advantage of the nutrient content or soil conditioning properties, or both, of quality-certified sludge, by supplying agronomic or soil conditioning benefits, such as the nitrogen, phosphorus, micronutrients, or organic matter needs for crops, forested land, or reclamation by land applying the sludge in accordance with these rules so as to not pose a significant risk to public health or the environment.

"Exceptional quality (EQ)" means a designation of solids or filtrate derived from septage which indicates that the solids or filtrate:

- (a) Meets pathogen reduction requirements under 40 CFR part 503.32(a)(3), 503.32(a)(4), 503.32(a)(5), 503.32(a)(6), 503.32(a)(7), or 503.32(a)(8);
- (b) Meets one of the vector attraction reduction requirements of 40 CFR part 503.33(b)(1) through (b)(8)
- (c) Has a density of fecal coliform of less than 1,000 Most Probable Number (MPN) per 4 grams Dry weight for solids or a density of fecal coliform of less than 2.2 colonies per 100 ml for filtrate; and
- (d) Meets the metals requirements of Env-Wq 1613.03(c) and (d)
