

1. Where does our water come from?

We source our water from the Ellenburger-San Saba aquifer. This aquifer provides relatively good quality water for household use.

2. How many wells does DHCWSC have?

We have a network of 3 wells which adequately services approximately 100 households. Our well network will adequately support demand for a forecast of about 200 households *under normal rainfall conditions*. Drought conditions will quickly impact the availability of our well water because our wells are located on the outer edge of the aquifer.

3. How is the water treated?

We treat our water in accordance with the Texas Commission of Environmental Quality (TCEQ) standard for public water supply systems. We treat the water with chlorine before it is delivered to households.

4. We are putting in a new swimming pool at our home. Can we use the water provided by DHCWSC to fill our new pool?

Filling a new swimming pool with water provided by the DHCWSC is not permitted.

5. Is either chloramine or ammonia added to our water?

No. Only chlorine gas is used in the purification process.
