

~ Why We Can't Cure The Common COVID ~

Pt. - 3

We went from the chicken to the peanut gaining understanding on the nature of what ADE (Antibody Dependent Enhancement) Syndrome, albeit a seriously truncated outline, it's hoped enough clarity on that to move on.

Interestingly enough, THIS rabbit hole doubles back on itself and heads back to the chicken, where the next point of understanding can be seen.

Merrick's Disease.

An INDUCED disease.

Most are aware the poultry industry has some "issues" and one of the more tragic one is this disease.

In cramped quarters and fed who knows what anymore to plump them up horribly, often where they cannot move. REGULAR inoculations against the myriad strains of flu and cold virii, including C. mRNA is only COMPLETELY APPROVED FOR LIVESTOCK, ALL OTHER USES ARE STILL UNDER EMERGENCY AUTHORIZATION ONLY.

Merrick's Disease is ADE Syndrome induced, as well. What occurs, over time, the mRNA degrades the native immune system, essentially 'hi-jacking' it and RECODING the NEW DNA that those cells will be making.

In this case, spiked proteins are signaled to synthesize and the immune response triggers, BYPASSING the 'sentinel' cells, aka 'Killer-T' cells. Largely turning them OFF.

The chickens devolve and cannot withstand exposure anymore and need CONSTANT BOOSTERS.

'breakthrough cases'

'super-cold'

(Nah, same old cold... just someone unlocked all the doors is all...)

Highest Regards and Much Love,

Kevin
