

Sealing The Knots on Your Wig.

Seal the knots of your wig before wearing it for the first time and after each wash.

Prior to wearing your wig for the first time and after each wash, it is recommended to seal the knots to minimize shedding and prolong the lifespan of the wig, particularly for lace or mesh units.

When applying the product, please adhere to the product instructions. It is advisable to apply two applications and utilize a hair dryer in between each application to facilitate the drying process. Exercise caution when using the hair dryer. Use it for only a few seconds at a time to prevent any risk of burning the lace or base of the wig. It is imperative that the knot sealer is allowed to completely dry before wearing your wig. It is common for the wig base to feel slightly stiff initially after sealing the knots.

*Do this after
each washing.*

Additionally, a firm-hold hairspray can serve as an alternative method to seal the knots. Simply turn the wig inside out and apply two or three generous coatings of hairspray to the base. Use a hair dryer to thoroughly dry each application.

Exercise caution to avoid over spraying the knot sealer or hairspray onto the exposed hair during application, as it may result in stiffness. To prevent this, consider covering the hair by placing the wig in a plastic bag, ensuring only the base is exposed during the sealing process. This precaution helps maintain the hair's natural feel and texture.
