

INVESTOR Q&A

What sets our solution apart from our competitors?

Our most prominent market competitors, Filecoin and Arweave, have the distinct user security disadvantage of relying on client hardware for storage. This is what sets our yet-to-be officially branded solution apart, the decentralized server solution that a market of 200 million parked domains seeks to address. It is effectively accomplished without dedicating physical client resources subject to port attacks, instability, and hardware dependency issues, providing a trusted low-maintenance client solution across a purely decentralized system.

How is this different from traditional domain parking models?

Recent ad revenues have declined for traditional domain parking applications and domains are losing out on potential returns. Our platform is on track to turn that around with a two-tiered revenue stream: domain owners profit from ad revenue and token value increases with purchased Blockchain storage.

What makes our token valuable?

Unlike meme tokens and joke tokens (no offense to the President), our token has value.

The value is based on rewards for client ad revenue from parked domains, and corresponding blockchain storage purchasing power. Token valuation is expected to remain within a percentage of, and not to exceed, marketable storage value.

What is the investor risk?

Basically, the risk in decentralized web 3 storage is directly pegged to risks in the viability of the internet. There are nearly zero known threats to the internet as a whole so the web storage model that our Company is using is considered one of the most stable tech investments going forward.

What is the projected growth?

Conservative projections will bring in up to 40% of the 200 million potential domain signups. This is the recent historical market and does not account for an increase in future domain usage for parking storage.
