

ADDCO PTS-2000TM

OPTIONAL ACCESSORIES

MADE IN
USA

JTI offers the highest quality, most reliable and easiest to deploy and operate portable traffic signals in the industry. We can build a portable traffic signal to meet any specification and offer the full range of features and options, including these popular accessories.

GALAXY WAIT TIME AND FAULT DISPLAY SYSTEM

Keeps motorists informed by displaying real-time status messages about the amount of time remaining before the portable traffic signal turns green. If a fault occurs, it displays a message for motorists.

GALAXY CLEARANCE TIME EXTENDER

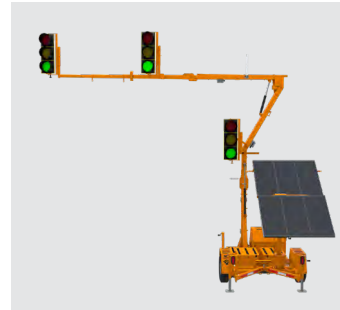

Detects slow moving vehicles in work zones and extends the red clearance interval in real time to ensure traffic safely clears the work zone before the interval expires.

GALAXY WIRELESS SIGNAL INTERFACE SYSTEM

Wirelessly connects to NEMA street corner controllers. The portable traffic signal then assumes the standard function of the corner controller. The perfect solution for knockdowns.

ADDCO PTS-2000 EXTENDABLE ARM

Ideal for multi-lane intersections or where left turn lanes are present. The 15' long extended arm meets MUTCD requirements and allows for easy signal head placement over a second lane of traffic.

GALAXY STATION CONTROL SYSTEM

Enables full manual control and override of ADDCO PTS-2000 portable traffic signals for applications such as a drawbridge operation within a work zone that includes portable traffic signals, fire station control for direct preemption activation, and many more custom uses.

PEDESTRIAN SIGNALS

The ADDCO PTS-2000 is available with integrated pedestrian signals. This feature adds safety when portable traffic signals are used in intersections with pedestrian crosswalks.
