BioGreen

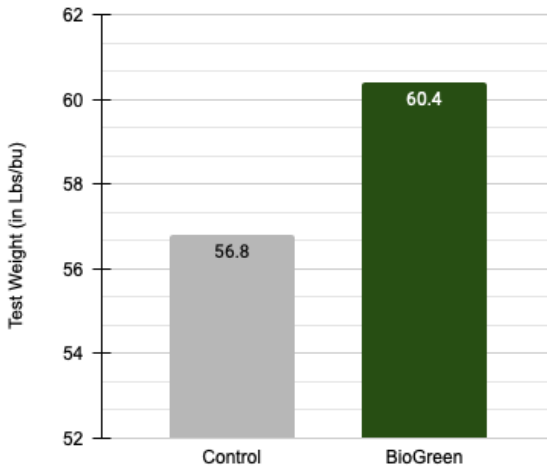

BioGreen is a nutrient stabilizer that contains microbes targeted for Nitrogen fixation, Phosphorous fixation, micronutrient absorption, and root growth.

Control

A **3.6 lb/bu** average increase in Test Weight

A **19 bu/acre** average increase in Yield

BioGreen is a nutrient stabilizing, growth promoting microbial formula that acts quickly in the soil and plant. BioGreen is also manufactured using Pursanova activated water technology. This allows the product to penetrate deeper into the soil profile and plant tissues at an optimized frequency for plant processes.

BioGreen is designed to target the fixation of key nutrients including Nitrogen, Phosphorus, Potassium, and Calcium. Improving the overall soil health also allows for increased absorption of micronutrients and trace minerals like Boron, Zinc, Copper, and Selenium.

Using BioGreen in your program:

- Reduces the need for synthetic Nitrogen fertilizers.
- Assists in the conversion of available Phosphorous.
- Promotes photosynthesis and fruit fill.
- Improves capillary uptake and metabolic pathways.
- Reduces pathogenic disease pressure.
- Improves water holding capacity.

BioGreen is a soil and plant detoxifying blend of natural exudates and beneficial microorganisms.
