

# The Power Facts Behind A Power Flush

Call us Today - 020 3488 6939

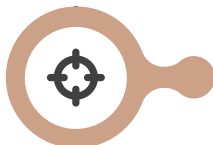

## 01 Keeping It Clean

Making sure that your system water (the water that lives in your pipes and radiators) is clean and free of sludge will mean that your heating system is more efficient

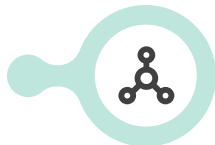

## 02 Boiler Life

A Power flush is good for the ongoing life of your boiler and central heating system. Regular maintenance will increase life span which will save money in the long run.

## 03 Signs to look out for

A clear sign that your system may be overly working and costing you more money is if you have cold spots at the bottom on your radiators, or if some of your radiators take longer to heat up compared with others.

## 04 Power Flush

A Powerflush is a cleansing process for your boiler and heaters. A power flush will be more effective at removing the blockage from your system, it does require specialist equipment and can take up to 5 hours.

## 05 How Often?

This depends on the material your radiators are made out of, the age and type of your boiler, and the hardness of your water. The short and generally agreed upon answer is that you should flush your radiators every 5 to 6 years.

## 06 Is It Worth It?

Of course! Like any maintenance this will ensure the quality of heating systems water is maintained to a high standard and help prevent damage to metallic components, as well as the development of blockages.
