Vaccination Schedule:

Foals:

- Deworm at 2-4 weeks of age, then monthly, alternating between Strongid (pyrantel) and Panacur (fenbendazole). Dose according to current weight. Continue this regimen until one year old.
- Begin vaccinations at 3-4 months of age or as otherwise determined by the doctor.
- Booster vaccines 4 weeks later, then follow adult schedule.

Adult Horses:

- Core (every 6 months) Includes:
 - o Rabies
 - o Tetanus, Eastern & Western Equine Encephalomyelitis
 - o West Nile
- Influenza/Rhinopneumonitis: Every 6 months
- Strangles: Given yearly prior to likely exposure.
- Coggins (EIA): Once yearly
- Other vaccines may be recommended based on risk, such as Leptospirosis & Botvax

Notes:

- Pregnant Mares should receive Rhinopneumonitis at 5th, 7th, and 9th months of pregnancy. Routine vaccines to be given approximately one month before foaling.
- Foals need IGg test at 12-24 hours and newborn treatments, including enema, iodine navel, and selenium injection
- Dental Care: Assessed during Wellness Exams every 6 months and treatment performed as needed.
- Hoof Care: Performed at least quarterly, generally every six to eight weeks (hooves assessed during Wellness Exams every 6 months)
