PROTECT

Ceramic coatings are scientifically engineered to protect the top layer of material on a vehicle. By creating a quartz-like transparent shell, this ultra-hard coating latches to the surface of paint through covalent bonds. Through this, ceramic coatings offer five-year protection against swirl marks and external elements such as UV rays, dirt, road salt, tree sap, and bird droppings.

BEAUTIFY

When a ceramic coating cures, it's basically a microscopic layer of unbreakable glass. This amplifies the shine and luster of paint and makes matte finishes on plastic trim appear deep and rich.

MAINTAIN

Along with the protection and visual effects they offer, ceramic coatings also work to make regular maintenance of your vehicle easier. By using hydrophobic properties, ceramic coatings fend off dirt and make washing your car as easy as giving it a quick rinse.

REPEL

One of the most popular characteristics of ceramic coatings is their ability to repel water, dirt, and a wide variety of contaminants. Ceramic coatings provide hydrophobic properties by increasing the contact angle of liquids, forcing them to form into beads and roll off the surface of the paint.
