Notes:

1. Test frequency: L : 100KHz /0.1V;
2. All test in 25 °C temperature.
3. Heating Rating Current (Irms) will cause the coil temperature rise of 40°C approximately (Δt);
4. Saturation Current (Isat) will cause L0 to drop 30% approximately.
5. The part temperature (ambient + temp rise) should not exceed 125°C under the worst-case operating condition. Circuit design, component, PCB trace size and thickness airflow and other cooling provisions all could affect the part temperature. Part temperature should be verified in the end application.
6. Special inquiries besides the above commonly used types can be met on your requirement.
