Instructions to Change a Welker Cake Feeder Winch

Motor to a Welker Cake Feeder Electric Motor

Take the caker off of the flatbed and flip it over. This will make it much easier to replace and install the new motor & gearbox system.

Remove your current winch-motor mount system.

Position the new motor mount 10 inches from the pit, on the left side of the caker, so that the sprocket and chain are perfectly straight and aligned.

Weld the motor mount securely in place.

Please make sure to install the brass breather plug before bolting the motor to the gearbox after installing the motor mount plate. Then remove the shaft protector prior to installing the sprocket. Ensure the motor key is properly seated in the keyway. You will adjust the chain tension as needed for your specific cake feeder.
