Open standards in smart farming

ORIGIN CHAIN NETWORKS FOR WWW.CFCHUB.ORG

What is smart-farming?

Smart-farming is the digital augmentation of agricultural practice, including animal husbandry, agronomy, viticulture and orchard management as well as forestry, heath and peat management and more.

Smart-farming is .an emerging domain. It is comprised of technical, business and social elements., requiring multi-stakeholder engagement, and up-skilling and enablement of digital agri-innovation.

Smart-farming involves identifying and creating taxonomies of stateful, geolocated subjects, objects, processes and custodial entities within an agri-food system. Objects and entities might include commercially owned land, production facilities, herds and/or crops,, supplies, produce and machinery. Each object or entity must be identifiable to the system, it may also have a digital representation such as a digital twin, a simulated local terrain or a mirror population in order to better communicate and visualise the digital information associated with a physical thing.

From the technical perspective, smart-farming is the application of ubiquitous, pervasive and ambient computing in agriculture*. These approaches facilitate multiple devices (input/output interfaces) in complex multi-party systems. The systems themselves are cloud and mesh networks at the edge, connecting to wifi, mobile 5G or satellite internet.

Smart-farming and the Digital Marketplace

From the business perspective farming and agri-food are highly monitored and regulated, for public health and social stability.

The European food system places a high value on food safety, security and integrity and farmers are rewarded for how they produce food, to assure sufficiently high standards of safety, sustainability and nutrition.

Smart-farming helps farmers to meet and exceed the standards set by their local administration, their Coops and the European or other national and regional trade standards. Smart-farming enables digital transformation and connectedness, enhancing farm management practices, with up to date information and services that address user and market needs.

Meeting the climate imperative

To meet the challenge presented by climate change for agriculture digitally enhanced collaboration, knowledge-sharing and decision-assistance are a necessary part of the solution.

De-risking the required large scale collective transition to regenerative and soil preserving on-farm practices can be achieved by facilitating collective action, accelerated knowledge transfer and locally evidenced solutions, with assurance and validation provided by field data, scientific research, market sentiment and brand awareness. Decisions and actions taken may be shared in ways that optimise for impact and sustainable results.
