Why Wood Flooring?

Wood floors keep your feet warm and cosy in cooler climates and comfortably cool in summer, thanks to the natural cellular structure of precious wood. Wood floors are easy to maintain, simply requiring regular dusting or vacuuming and the occasional damp mop. They are also cost-effective thermal insulators and have an excellent ecological pedigree. Every cubic meter of wood used as a substitute for other building materials reduces CO2 emissions by, on average, 1.1 tonnes.

What is Engineered Flooring?

Don't confuse engineered wood flooring with laminate or veneer. Laminate is simply an image of wood, whilst veneer uses only a very thin layer of the real thing over a core of some type of composite, usually fiberboard. Engineered wood is now the preferred type of timber flooring fitted worldwide, Engineered Planks are multi-layered: a 100% natural hardwood top layer and a strong, stable core of crisscrossed layers of pressed wood.

Why Slim Planks?

Traditional narrow planks can be used to elongate any room. With the thin boards drawing the eye down the full length of the space. Here at Lamiwood, we classify narrow planks as anything 125mm wide or under and have a unique range of products available. In addition, because there are more boards on the floor, narrow plank floors tend to be easier to maintain as there is less expansion and contraction in the wood making it super stable and durable for years to come.

Why Variation in Colour?

One of the factors that make nature so beautiful is the constant variation. You can't find two trees that are the same. Therefore, the appearance of the precious wood on top of wood floors also varies. Our engineered flooring is produced from European oak. This is sometimes known by its country of origin - French oak, English oak, German oak, etc. and it actually encompasses two different species of white oak. It is similar to American white oak but a little darker in tone with a finer grain and growth rings, and it exhibits more even colouring. It is heavy and relatively expensive timber, but very strong, hard, tough and durable. Other benefits are that it is practically sap-free and takes staining & fuming particularly well.

Is It Safe?

A lot of people are concerned about how their new floor will affect the air quality of your space and you should be. The type of glue used in the production of the engineered wood floor as well as the finish on top of the wood floor is a common subject for concern. VOC stands for Volatile Organic Compounds and is emitted as gases from certain solids or liquids, one of these is formaldehyde. All of Our Engineered Flooring products at Lamiwood are E0 Standard which means that there is no added formaldehyde in any of our products. So you can be sure of breathing fresh air inside your home, without any harmful emissions from your wood flooring.
