What are the Essential Oils?

Essential oils are obtained from the seeds, bark, stems, roots, flowers, and other parts of plants with their essence. These can be both beautifully and powerfully fragrant. Essential oils excite powerful emotional responses, yet the use of essential oils goes well beyond their aromatic appeal. Essential oils are used since ancient times for their health-promoting properties. Modern trends toward more holistic ways to self-care and growing scientific validation of alternative health practices are driving a rediscovery of the profound health benefits of essential oils. Many oils have powerful cleansing properties; they have a unique chemical structure that allows them to deliver targeted benefits through topical application.

Extraction Methods

Essential oils are extracted by the steam distillation method; in this process steam is circulated under pressure through plant material, liberating the essential oils into the steam. As the steam mixture cools, the water and oils are separated and the oil is collected in its pure form.

Essential Oil Uses

Essential oils are used for a wide range of emotional & physical wellness applications. These can be used individually or in a complex blend. Essential oils are used in three different methods: diffused aromatically, applied topically to the skin, or taken internally as dietary supplements. When essential oils are used these can be both profoundly simple and life-changing at the same time. Essential oils are naturally safe and have few if any, undesirable side effects when used as directed. They are powerfully concentrated and should be used with care. If redness or irritation occurs when using essential oils topically, apply vegetable oil. Consult your physician before using essential oils if you are pregnant or under a doctor's care.

Where to Begin

Using essential oils is intuitively easy and extremely satisfying. However, the many oils available, with their numberless combinations and wellness applications, can be a bit overwhelming to beginners. As a simple first step on your journey with essential oils, we recommend a trio of Lavender, Lemon, and Peppermint. Three of our most popular oils will provide you and your family a compelling experience with the life-enhancing properties of essential oils.

Essential Oils

- Rosemary Essential Oil/*Rosmarinus officinalis*

What are Carrier Oils?

Carrier oils are used for diluting essential oils. These are known as base oils or vegetable oils. Carrier oils are the best way to use them for safe use. These allow essential oils to spread easily & safely. Essential oils are lively which means these can disappear soon after applying. Carrier oils make this process slow.

Carrier oils are used in different ways. Best oils have their characteristics & therapeutic benefits. Every blend has its impact.

Extraction Method

Carrier oils are obtained from the nuts & seeds; they undergo the cold pressing method. This method is a chemical-free process. This includes keeping the nuts in seeds in the horizontal press known as expeller. The nuts & seeds drive through a battle-shaped hollow & compress until the oil comes. This oil is filtered that results in the finished product. The clean & pure oil comes out as solvent residues are not present in this method. The friction can create some heat during the process but this heat can cause some damage to the oil.
