IMPORTANT NOTICE

- OPERATOR ONLY. NO PASSENGERS.

This vehicle is designed and constructed as an operator-only model. The vehicle load limit and seating configuration do not safely permit the carrying of a passenger.

- FOR OFF-ROAD USE ONLY.

This vehicle is designed and manufactured for off-road use only. It conforms with US EPA Noise Emission regulations, but does not conform to Federal Motor Vehicle Safety Standards or US EPA Exhaust Emission regulations, and operation on public streets, roads, or highways is illegal. The vehicle is equipped with a USDA approved spark arrester. Obey local laws and regulations.

- READ THIS OWNER'S MANUAL CAREFULLY

Pay special attention to statements preceded by the following words:

⚠ WARNING

Indicates a strong possibility of severe personal injury or loss of life if instructions are not followed.

CAUTION:

Indicates a possibility of personal injury or equipment damage if instructions are not followed.

NOTE: Gives helpful information.

This manual should be considered a permanent part of the ATC and should remain with the ATC when resold.
All information in this publication is based on the best information available at the time of approval for printing. Honda reserves the right to make changes at any time without notice and without incurring obligations. No part of this publication may be reproduced without permission.

© Honda Motor Co.
This booklet is your guide to the basic operation and proper maintenance of your new Honda ATC200M. Please take the time to read it carefully. Details necessary for riding the Honda ATC are given to acquaint the new owner with special riding techniques to be learned. When service is required, remember that your Honda dealer knows your vehicle best. If you have the required mechanical "know-how" and tools, your dealer can supply you with an official Honda Shop Manual to help you perform many maintenance and repair tasks.

Thank you for selecting a Honda. We wish you continued riding pleasure in the miles ahead.

**WARNING**

* ATC-riding requires special efforts on your part to ensure your safety. Know these requirements before you ride.

**SAFE RIDING RULES**

* Always make a pre-ride inspection (page 19) before you start the engine. You may prevent an accident or equipment damage.
* Always obey local off-road riding laws and regulations.
* Obtain permission to ride on private property. Avoid posted areas and obey “no trespassing” signs.
* Know the terrain on which you are riding. If you are not familiar with the terrain, ride cautiously. Hidden rocks, holes or ravines could spell disaster.
* Your ability to operate safely is largely dependent upon your proper judgement in operating the ATC.
* Do not use the flag pole bracket as a trailer hitch.

**PROTECTIVE APPAREL**

* Most motorcycle accident fatalities are head injuries; ALWAYS wear a helmet. You should also wear a face shield or goggles and protective clothing.
* The exhaust system becomes very hot after operation and it remains hot after operation. Do not touch any part of the hot exhaust system. Wear clothing that fully covers your legs.

**MODIFICATIONS**

* Modification of the ATC, or removal of equipment, may render the vehicle unsafe and illegal.
* Spark arresters and mufflers are required in many areas. Don’t modify your exhaust system. Remember that excessive noise bothers everyone and creates a bad image for motorcycling.
DESCRIPTION

1. Front brake lever
2. Throttle lever
3. Neutral indicator lamp
4. Rear brake lever/parking brake
5. Fuel tank cap
6. Fuel valve
7. Recoil starter
8. Gearshift pedal
9. Neutral indicator
(10) Ignition switch
(11) Choke knob
(12) Starter button
(13) Headlight switch
(14) Engine stop switch
(15) Oil filler cap
SERIAL NUMBERS

The frame and engine serial numbers are required by the dealer when ordering replacement parts. Be sure to note the numbers here for your reference.

FRAME NO. ____________________ 

(1) Frame serial number

The frame serial number (1) is stamped on the left side of the steering head. The engine serial number (2) is stamped on the crankcase just above the left footpeg.

ENGINE NO. ____________________

(2) Engine serial number
PARTS FUNCTION

Ignition Switch

The ignition switch (1) is on the handlebar upper holder.

![Ignition Switch](image)

<table>
<thead>
<tr>
<th>Key Position</th>
<th>Function</th>
<th>Key Removal</th>
</tr>
</thead>
<tbody>
<tr>
<td>OFF</td>
<td>Engine and headlight cannot be operated.</td>
<td>The key can be removed.</td>
</tr>
<tr>
<td>ON</td>
<td>Headlight can be turned on. With the engine stop switch at RUN and transmission in neutral, the engine can be started.</td>
<td>The key cannot be removed.</td>
</tr>
</tbody>
</table>
Engine Stop Switch

The three position engine stop switch (1) is next to the left handlebar grip. In RUN, the engine will operate. In either OFF position, the engine will not operate. This switch is intended primarily as a safety or emergency switch and should normally remain in RUN.

NOTE:
* If your ATC is stopped with the ignition switch ON and the engine stop switch OFF, the headlight will still be on, resulting in battery discharge.

Starter Button

The starter button (2) is below the headlight switch. When the starter button is pressed, the starter motor will crank the engine.

(1) Engine stop switch  (2) Starter button
Headlight Switch

The headlight switch (1) is below the engine stop switch. Its operating positions are as follows:

<table>
<thead>
<tr>
<th>Position</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>OFF</td>
<td>Headlight is off.</td>
</tr>
<tr>
<td>LO</td>
<td>Headlight is on low beam.</td>
</tr>
<tr>
<td>HI</td>
<td>Headlight is on high beam.</td>
</tr>
</tbody>
</table>

(1) Headlight switch
Throttle Lever
The throttle lever (1) is next to the right handlebar grip and is operated by the rider's thumb. Pressing the lever forward opens the throttle. When the lever is released, spring tension closes the throttle automatically.

Brake Lever/Parking Brake
The front brake lever is at the right handlebar grip. The left brake lever (1) and the brake pedal both operate the rear wheel brake. Either one can be used to stop the ATC. The left brake lever has the added feature of a lock (2) which allows the lever to be used as a parking brake.

Pull the left brake lever back and lock it with the lock. Always apply the parking brake when parking on a hill.

The parking brake is unlocked by squeezing the left brake lever.

NOTE:
* Use of the parking brake in freezing weather may cause the brakes to freeze in the locked position.
Gearshift Pedal

The gearshift pedal (1) is near the left footpeg. One
full stroke of the gearshift pedal will shift the trans-
mision. The pedal automatically returns to the
horizontal position when released. Each stroke of the
pedal engages the next gear in sequence.
Depress the pedal to up shift to a higher gear and
raise the pedal to downshift.

(1) Gearshift pedal

(1) Shifting sequence
Neutral Indicator/Neutral Indicator Lamp

The ATC 200M is equipped with two indicators to show when the transmission is in neutral. This feature enables the rider to verify that the transmission is in neutral before starting the engine.

The neutral indicator lamp (1) is on the handlebar upper holder. When the ignition switch is turned to ON, the lamp lights if the transmission is in neutral. If the lamp does not light, shift the transmission into neutral, whereupon the lamp will light.

The neutral indicator (2) is on the left crankcase cover, just behind the recoil starter. The indicator rotates as the gears are changed. When the indicator aligns with the N mark on the crankcase, the transmission is in neutral.
Decompressor

The Honda ATC200M has a decompressor lever (1), located on the right side of the cylinder head, to aid starting when using the recoil starter. Before starting the engine, raise the lever to the DECOMP position (A). The lever moves down automatically when the recoil starter is pulled.

NOTE:
* If the lever does not stay in the DECOMP position, there is no cylinder compression to release. Just pull the recoil starter to start the engine.
Choke Lever
The choke knob (1) is on the handlebar upper holder. Pulling the choke knob up will close the choke, and the carburetor will deliver a rich fuel mixture for starting the engine when cold. Lower the lever to open the choke as the engine attains normal operating temperature. To restart a warm engine, it is not necessary to use the choke.

Fuse Replacement
The fuse holder (1) is under seat. The specified fuse is 7 A. When frequent fuse failure occurs, it usually indicates a short circuit or an overload in the electrical system. See your authorized Honda dealer for repair.

WARNING
* Never use a fuse with a different rating from that specified. Serious damage to the electrical system or a fire may result, causing a dangerous loss of lights or engine power at night or in traffic.

CAUTION:
* Turn the ignition switch OFF before checking or replacing the fuse to prevent accidental short-circuiting.

(1) Choke knob
FUEL

Fuel Valve
The three way fuel valve (1) is on the left side of the carburetor.

OFF
At OFF, fuel cannot flow from the tank to the carburetor. Turn the valve off whenever the ATC is not in use.

ON
At ON, fuel will flow from the main fuel supply to the carburetor.

RES
At RES, fuel will flow from the reserve fuel supply to the carburetor. Use the reserve fuel only when the main supply is gone. Refill the tank as soon as possible after switching to RES. The reserve fuel supply is 1.0l (0.26 US gal).

NOTE:
* Do not operate the ATC with the fuel valve in the RES position after refueling. You may run out of fuel with no reserve.
Fuel Tank

Fuel tank capacity is 11.5\(\ell\) (3.0 US gal) including 1.0\(\ell\) (0.26 US gal) in the reserve supply. Remove the fuel tank cap (1) by twisting it counterclockwise. Any automotive gasoline with a pump octane number \(\frac{R+M}{2}\) of 86 or higher, or research octane number of 91 or higher may be used. If knocking or pinging occurs, try a different brand of gasoline or a higher octane grade. After refueling, be sure to tighten the tank cap firmly by turning it clockwise until the arrow on the cap faces forward.

The fuel tank cap (1) has a lever (2) with ON and OFF positions to open or close the tank vent. The lever should be turned to ON to allow fuel to flow when running the engine. Turning the lever to OFF will prevent fuel from flowing out the vent hole when transporting the ATC.

**WARNING**

* Gasoline is extremely flammable and is explosive under certain conditions. Refuel in a well-ventilated area with the engine stopped. Do not smoke or allow open flames or sparks in the area where the vehicle is refueled or where gasoline is stored.

* Do not overfill the tank (there should be no fuel in the filler neck). After refueling, make sure the tank cap is closed securely.

* Avoid repeated or prolonged contact with skin or breathing of vapor. KEEP OUT OF REACH OF CHILDREN.
ENGINE OIL

Engine Oil Level Check

Check the engine oil level each day before operating the ATC.
The oil filler cap (1) is on the right crankcase cover and contains a dipstick for measuring the oil level. The oil level must be maintained between the upper (2) and lower (3) level marks on the dipstick.
1. With the ATC on level ground, remove the oil filler cap/dipstick and wipe it clean.
2. Reinsert the dipstick without screwing it in. Remove the oil filler cap/dipstick again and check the oil level.
3. If required, add the specified oil up to the upper level mark. Do not overfill.
4. Reinstall the filler cap/dipstick.

CAUTION:

* Running the engine with insufficient oil can cause serious engine damage.

(1) Oil filler cap/dipstick (3) Lower level mark
(2) Upper level mark
Engine Oil Recommendation

USE HONDA 4-STROKE OIL OR AN EQUIVALENT.

Use only high detergent, premium quality motor oil certified to meet or exceed US automobile manufacturers' requirements for Service Classification SE or SF.

Motor oils intended for Service SE or SF will show this designation on the container. The use of special oil additives is unnecessary and will only increase operating expenses.

CAUTION:

* Engine oil is a major factor affecting the performance and service life of the engine. Non-detergent, vegetable, or castor based racing oils, are not recommended.

Recommended Oil Viscosity:

SAE 10W-40

Other viscosities shown in the chart below may be used when the average temperature in your riding area is within the indicated range.
TIRES

The ATC200M is equipped with 25x12-9 low pressure tubeless tires to provide a comfortable ride. Although the tires are designed specifically for vigorous off-road use, they are not immune to punctures. Always select your riding area with care.

CAUTION:

* Driving on paved surfaces will cause excessive tire wear.

For normal use, the tires should be inflated to a recommended pressure of 2.2 psi (15 kPa, 0.15 kg/cm²). A manually operated tire pump should be used rather than the high pressure systems found in service stations. This will minimize the possibility of tire damage from overinflation.

NOTE:

* Tire pressure should be checked when the tires are “cold,” before you ride.

If no air pressure gauge is available to accurately measure air pressure, this value can be estimated by measuring the circumference of the tires with a measuring tape. When inflated to 2.2 psi (15 kPa, 0.15 kg/cm²), the maximum tire circumference measured over the tread ribs will be approximately 1,920 mm (75.6 in.). The relationship between tire pressure and actual circumference varies slightly with factors of wear and stretching that occur through use.

Recommended Pressure: 2.2 psi (15 kPa, 0.15 kg/cm²)
Standard Tire Circumference: 1,920 mm (75.6 in.)
Max. Pressure: 2.6 psi (18 kPa, 0.18 kg/cm²)
Min. Pressure: 1.7 psi (12 kPa, 0.12 kg/cm²)
**WARNING**

* Be sure to inflate both rear tires equally. If the ATC is operated with unequal tire pressures, the resultant difference in tire circumference will cause the ATC to run toward one side and will adversely affect handling.

**CAUTION:**

* Maintain proper tire pressure. Underinflated tires may adversely affect maneuverability and cause wheel damage when riding over bumpy terrain. Overinflated tires may damage the tires, or hub on the fenders and hamper movement of the ATC.

If you have a flat tire, use the plug method to make temporary repairs. The plug method is the same as that for conventional tubeless tires. A plug type repair kit, which is available at most auto part stores or service stations, provides a plug, an installation tool, tire cement, and an instruction sheet. Follow the instructions provided in the repair kit to make a temporary repair until the tire can be permanently repaired by the cold patch method. Any tire which cannot be repaired by the plug method should be replaced.

Whenever the ATC is to be operated far from service facilities or available transportation, we recommend that the rider carry a tire pump and a suitable repair kit with the ATC.
PRE-RIDE INSPECTION

**WARNING**

* If the Pre-ride Inspection is not performed, serious damage or an accident may result.

Inspect your ATC every day before you start the engine. The items listed here will only take a few minutes to check and in the long run can save time, expense, and possibly your life.

1. Engine oil level — if required add engine oil (page 15). Check for leaks.
2. Fuel level — fill the fuel tank when necessary (page 14). Check for leaks.
3. Brakes — check operation. If necessary adjust free play (page 47).
4. Tires — check condition and pressure (page 17).
5. Drive chain — check condition and slack (page 53). If necessary adjust and lubricate.
6. Throttle — check for smooth opening and closing in all steering positions (page 50).
7. Headlight switch — check for proper function (page 7).

8. Engine stop switch — check for proper function (page 6).
9. Nuts, Bolts, Fasteners — check the wheels to see that the axle nuts are tightened and secured by cotter pins. Check the security of all other nuts, bolts and fasteners.

Correct any discrepancy before you ride. Contact your authorized Honda dealer for assistance if you cannot correct the problem.
STARTING THE ENGINE

**WARNING**

* Never run the engine in a closed area. The exhaust contains poisonous carbon monoxide gas.
* Do not try to start the engine with the transmission in gear. You may injure yourself or damage the vehicle.

Preparation

1. Lock the parking brake before starting the engine.
2. Turn the fuel cap vent lever (1) and fuel valve (2) to ON.
3. Make sure the engine stop switch (3) is at RUN.
4. Make sure that the transmission is in neutral by lifting the shift lever and checking that the neutral indicator (4) is at N or the neutral indicator lamp lights.

(1) Vent lever  (2) Fuel valve  (3) Engine stop switch  (4) Neutral indicator
Starting Procedure (after Preparation)

To restart a warm engine, follow the procedure for High Air Temperature.

Normal Air Temperature
10°–35°C (50°–95°F)
1. Raise the choke knob (5) to the Fully Closed position (A).
2. Turn the ignition switch (6) to ON.
3. Open the throttle slightly.
4. Press the starter button (7) and start the engine.
NOTE:
* Do not use the electric starter for more than 5 seconds at a time. Release the starter button for approximately 10 seconds before pressing it again.

5. Immediately after the engine starts, release the starter button and push the choke knob to the half position (B).
6. About a half minute after the engine starts, push the choke knob down all the way to Fully Open (B).
7. If idling is unstable, open the throttle slightly.

High Air Temperature
35°C (95°F) or above
1. Do not use the choke.
2. Open the throttle slightly.
3. Start the engine by pressing the starter button.
Low Air Temperature

10°C (50°F) or below

1. Follow steps 1–5 under Normal Air Temperature.
2. Warm up the engine by opening and closing the throttle slightly.
3. Continue warming up the engine until it will idle smoothly with the choke knob pushed down all the way to Fully Open (C).

CAUTION:

* Extended use of the choke may impair piston and cylinder wall lubrication.
* Do not race the engine during the warm-up period. Racing a cold engine wastes fuel and increases engine wear.

Recoil Starting

If the engine does not start with the electric starter, use the recoil starter.
1. Raise the decompressor lever (1) up to the DE- COMP position.
2. To use the recoil starter, follow the steps under Preparation and 1–3 under Normal Air Temperature.

NOTE:

* A quick vigorous pull on the starter rope (2) will be the most effective way to start.

(1) Decompressor lever  (2) Recoil starter
Flooded Engine

If the engine does not start after several attempts, it may have become flooded with excess fuel. To clear the engine, turn the ignition switch OFF, push the choke knob down completely, hold the throttle fully open, and briefly press the starter button or pull the recoil starter rope several times.

When the engine is cleared, wait 10 seconds then turn the ignition switch ON and repeat the normal starting procedure, but do not use the choke.

BREAK-IN

During the first few days of riding, operate your new ATC200M so that the engine neither pulls laboriously nor approaches maximum rpm in any gear. Avoid full throttle operation, and shift gears frequently to vary engine speed. Careful break-in during the initial operating period will measurably extend the service life of the engine.
RIDING

WARNING

* Review ATC Safety (page 1) before you ride.
* Avoid “wheelies” and jumping as they may cause loss of control.
* Ride with your feet on the footpegs at all times. If your feet are removed from the footpegs and touch the ground while the ATC is moving, they may come in contact with the rear wheels.
* While carrying loads or pulling a trailer, use extreme caution when starting, stopping or turning the ATC.

Under normal riding conditions it is not necessary or desirable to touch the ground for balance. For your initial riding practice, select a safe area free of obstacles and with an even surface. Avoid paved surfaces as they make learning to maneuver more difficult, and will also significantly shorten tire life.

1. Make sure the transmission is in neutral and set the parking brake. Move the speed range selector lever to L (low) or H (high). You may now start the engine.
2. After the engine has been warmed up, release the parking brake. The ATC is ready for riding.
3. While the engine is idling, depress the gearshift pedal to shift into 1st (low) gear.
4. Increase engine speed by gradually opening the throttle.

5. When your speed increases, close the throttle and shift to 2nd gear by depressing the gearshift pedal.

CAUTION:

* Do not shift gears without closing the throttle. The engine and drive train could be damaged by overspeed and shock.

6. This sequence is repeated to progressively shift to 3rd, 4th and 5th (top) gear.

CAUTION:

* Do not move the Posi-Torque selector lever while riding, or damage to the sub-transmission may result.
* Do not tow the ATC or coast for long distances while the engine is off. The transmission will not be properly lubricated and damage may result.

Shifting sequence
Turning Maneuvers

For better traction in off-road use, the ATC has been fitted with a rear axle which drives both rear wheels equally at all times.

When negotiating a turn, the wheel on the outside of the turn must travel a wider radius and thus a greater distance than the inside wheel. As the rear axle does not permit a differing rate of wheel rotation, it is not enough to merely steer the ATC into a turn. The new rider must learn to shift his or her weight and control the throttle to allow the rear tires to negotiate the turn. This is the primary technique to be mastered in riding the Honda ATC. For your initial riding practice, operate the ATC in low gear.

Practice turning the ATC at slow, constant speeds. Defer higher speeds until you are confident of your proficiency.

To turn, steer in the direction of the turn, leaning your body to the inside of the turn, while supporting your weight on the outer footpeg. Use the throttle to maintain power throughout the turn.

This technique allows the ATC to lean slightly towards the outside, altering the balance of traction between the rear wheels sufficiently to allow them to turn.

Once this technique is learned, turning maneuvers can be performed within a relatively small area.
Incorrect turning techniques may cause the front wheel to slide straight ahead when steered without affecting the ATC's direction of travel. If this should occur, close the throttle and come to a stop. Then continue practicing the technique outlined on the preceding page.

If the front wheel tends to skid in mud or snow, you may be able to improve control under these conditions by leaning forward, transferring additional weight to the front wheel.

If the rear wheels inadvertently skid sideways, correct your slide by steering in the direction of the skid if you have room to perform this maneuver safely. Avoid braking or accelerating until you have regained directional control.

To avoid skids while traveling on slippery terrain, the rider must exercise a high degree of caution. Controlled skids and spins, when performed safely, add to the sport the rider can enjoy. However, as skidding maneuvers are inherently more hazardous than those performed under full traction, we must caution the rider to first master the basic techniques of handling before practicing any skidding maneuver.

Surface composition is, of course, a major factor affecting skidding capability. It is obviously easier to slide on packed snow than in deep sand. Surfaces with extremely low or extremely high coefficients of friction must not be used for skidding maneuvers. It is dangerous to skid on ice, because you may lose all directional control, and it is dangerous to skid on pavement, because you may regain traction suddenly and unexpectedly, which can cause you to lose your balance and overturn.
Climbing Hills

Practice climbing on evenly surfaced slopes of less than 20°. The ATC’s capability in climbing hills or traversing any specific terrain is dependent upon rider skill. As you gain experience in handling the ATC and learn the hazards to be encountered and your own limitations, you may then proceed to ride more challenging terrain. However, you must first be able to discern and avoid any hill or hazard that would cause the ATC to overturn.

The riding technique for hill climbing involves transferring your weight toward the front wheel to keep it in contact with the ground. This may be done by leaning forward, or for greater weight transfer, by standing on the footpegs and leaning forward.

Take a running start, in the appropriate gear and speed for the ascent, and climb at a steady rate of speed.

**WARNING**

* Do not apply power suddenly by opening the throttle or changing gears while ascending a hill, or the front wheel may rise from the ground. If the front wheel lifts, rider control will be lessened and the ATC may overturn backward.*
If you should find that you have incorrectly estimated climbing capability and lack the power or traction to continue the ascent, then turn the ATC around if space permits, while you still have the forward speed to do so and descend. Avoid stalling part way up a hill, as maneuvering will then become more difficult.

**WARNING**

* Before attempting a turn on a hillside, the rider should first master turning technique on level ground.

If you do lose all forward and can neither continue uphill nor maneuver the ATC under its own power, dismount and physically turn the machine around. If it cannot be turned and must be backed down, first shift the transmission into neutral. However, we strongly recommend that the rider turn the ATC around rather than back it downhill.

**WARNING**

* To avoid overturning, the rider must exercise a high degree of caution when dismounting or moving the ATC on a hillside.
Descending Hills

It is usually advisable to descend hills with the ATC pointed directly downhill, avoiding angles that would cause the vehicle to lean sharply to one side. As you approach the point of descent, stop and survey the terrain below. Never ride headlong past your limit of visibility. When you have picked a safe path of descent, shift the transmission into low gear and descend slowly with the throttle closed. Sit back on the seat, with arms extended and braced on the handlebars. When descending sand dunes, we recommend that the rider apply the brake intermittently to further reduce forward speed. Braking effectiveness is, of course, reduced while descending any incline with a loose surface.
Traversing Slopes

When riding across a slope at right angles to the incline of the hill, lean your body uphill to maintain balance and stability. On a loose surface such as sand, it may become necessary to steer slightly uphill in order to maintain your course of travel.

⚠️ WARNING

* Balance is more precarious while the ATC is tilted to one side. Avoid traversing slopes where there is slippery or difficult terrain.
Riding Through Water

**WARNING**

* Do not ford any stream with fast flowing water. The tires may float, making it difficult to maintain control.
* Do not ride the ATC through water beyond its limit.

The Honda ATC can ford water to a depth of approximately 10 inches, although the rider must be careful to avoid getting the spark plug or air cleaner wet.

When crossing streams, choose a course where both banks have gradual inclines. Proceed at a slow, steady speed, and take care to avoid submerged obstacles and slippery rocks.

After riding through water, the brakes may be less effective than normal. Test the brakes after traveling through any water, and if necessary, apply the brakes repeatedly until the heat of friction has dried them, and the brakes regain their normal effectiveness.

If they do not dry out and regain their effectiveness, stop the ATC and shut the engine OFF. Set the parking brake ON and drain any trapped water by removing the drain cap (1) from the bottom of the brake cover.

**CAUTION:**

* If any water drains, it is an indication that the rear brake seals must be replaced. Have these seals checked by your Honda dealer as soon as possible.

(1) Drain bolt
High Altitude Riding

When operating this vehicle at high altitudes the air-fuel mixture becomes overly rich. Above 6,000 feet (1,800 m) driveability and performance may be reduced and fuel consumption increased. The carburetor can be modified to compensate for this high altitude richness. However, the carburetor must be returned to standard factory specifications when lower altitude riding is desired. (See page 40.)

CAUTION:

* Sustained operation at altitudes below 5,000 feet (1,500 m) with high altitude carburetor modifications may cause engine overheating and damage.

PARKING:

1. Stop the vehicle, shift the transmission into neutral, turn the fuel valve, fuel cap lever, and ignition switch OFF.
2. Pull the parking brake lever and lock it. (See page 8.)
MAINTENANCE SCHEDULE

- The U.S. Environmental Protection Agency requires manufacturers to certify that vehicles built after January 1, 1983 will comply with applicable noise emission standards for one year or 3,000 km (1,865 miles) after the time of sale to the ultimate purchaser, when operated and maintained according to the instructions provided. Compliance with the terms of the Distributor’s Warranty for the Honda Vehicle Noise Emission Control System is necessary in order to keep the noise emission control system in effect. (USA only)

- The maintenance intervals shown in the following schedule are based upon average riding conditions. ATC’s subjected to severe use, or ridden in wet or unusually dusty areas, require more frequent servicing. Items marked * should be serviced by an authorized Honda dealer, unless the owner has the proper tools and is mechanically proficient. Other maintenance items are simple to perform and may be serviced by the owner. Perform the Pre-ride Inspection (Page 19) at each scheduled maintenance period.

WARNING

* Always turn the engine off before performing any maintenance operations unless otherwise stated.
* To maintain the safety and reliability of your HONDA ATC do not modify it and use only new genuine HONDA parts or their equivalent when servicing or repairing. The use of replacement parts which are not of equivalent quality may impair the operation of your ATC.

TOOL KIT

The tool kit is stored in the compartment (1) shown below. The tools provided are sufficient to perform routine maintenance and simple repairs. Any extensive work requiring additional tools should be performed by an authorized Honda motorcycle dealer. Listed below are the items included in the tool kit:

- 10x12mm open end wrench
- 14x17mm open end wrench
- 24mm box end wrench
- Handle for box end wrench
- 17mm box wrench
- Handle for screwdriver
- Screwdriver blade
- Pliers
- Tool bag

(1) Tool kit
(2) Lever
ENGINE OIL

Engine oil should be changed in accordance with the maintenance schedule. Use motor oils of the grade and viscosity recommended on Page 15. When changing oil, drain the oil from the crankcase while the engine is still warm. This will ensure complete and rapid draining.

1. Remove the oil filler cap from the right crankcase cover.
2. Place an oil drain pan under the crankcase and remove the oil drain plug (1) with a 24mm socket wrench.

NOTE:
* The oil filter screen (2) and spring (3) will come out when the drain plug is removed.

3. After the oil stops draining turn the ignition switch and engine stop switch OFF and pull the recoil starter several times to drain any oil which may be left in the engine.
4. Clean the oil filter screen.
5. Check that the oil filter screen, sealing rubber and drain plug O-ring are in good condition and install them with the drain plug.
6. Fill the crankcase with approximately 1.5⁰ (1.6 US qt) of the recommended grade of motor oil.
7. Make sure that the oil level is between the upper and lower marks on the dipstick. If necessary, add more oil but do not overfill.

(1) Drain plug

(2) Oil filter screen  (3) Spring
OIL FILTER ROTOR

1. Drain the oil from the engine.
2. Remove the right footpeg.
3. Remove the right crankcase cover bolts and cover (1).
4. Remove the oil filter rotor cover (2) and clean the inside of the rotor cover (2) and rotor.
5. Install the rotor cover, aligning the teeth on the friction spring with the groove in the cover.
6. Tighten the rotor cover bolts to 10–14 N·m (1.0–1.4 kg-m, 7–10 ft-lb) torque.

7. Install all other parts removed in the reverse order of removal.
8. Fill the crankcase with the recommended oil (page 15).

(1) Right crankcase cover

(2) Rotor cover
FUEL FILTER

The fuel filter is incorporated in the fuel valve. Accumulation of dirt in the filter will restrict the flow of fuel, therefore, the fuel filter should be serviced periodically.

1. Drain the fuel from the fuel tank. Disconnect the fuel line.

⚠️ WARNING

* Gasoline is extremely flammable and is explosive under certain conditions. Perform this operation in a well-ventilated area. Do not smoke or allow flames or sparks near the equipment while draining fuel.

2. Remove the fuel valve (1) by loosening the mounting nut and remove the fuel filter (2). Wash it in clean non-flammable or high flash point solvent.

⚠️ WARNING

* Never use gasoline or low flash point solvents for cleaning the fuel filter. A fire or explosion could result.

3. Reinstall the fuel filter and fuel valve in the reverse order of removal and turn the fuel valve ON. Check for leaks.

4. Check the fuel line (3) for deterioration, damage or leakage. Replace if necessary.
CARBURETOR

The engine must be warm for accurate idle adjustment. Ten minutes of stop-and-go riding is sufficient.

NOTE:
* Do not attempt to compensate for faults in other systems by carburetor adjustment. See your authorized Honda dealer for regularly scheduled carburetor adjustments.

1. Warm up the engine.
2. Adjust idle speed with the throttle stop screw (1).
   IDLE SPEED: 1,400 ± 100 rpm
3. To adjust the fuel mixture, turn the pilot screw (2) clockwise until you hear the engine miss or decrease in speed, then counterclockwise until the engine again misses or decreases in speed. Center the pilot screw exactly between these two extreme positions.

   Usually the correct setting (between extremes of rich and lean) will be found to be 2 turns open from a fully closed position.
If idle speed changes after adjusting the fuel mixture, readjust the throttle stop screw.
HIGH ALTITUDE

When operating this ATC at high altitude the air-fuel mixture becomes overly rich.
Above 6,000 feet (1,800 m) driveability and performance may be reduced and fuel consumption increased.
A high altitude jet is available for carburetor modification to compensate for this high altitude richness. Although installation and adjustment procedures are offered here. We strongly urge that this carburetor modification be performed by your authorized Honda dealer, unless you are mechanically proficient and have the necessary tools.

CAUTION:
* Sustained operation at lower altitudes below 5,000 feet (1,500 m) with the high altitude jet installed may cause engine overheating and damage.

<table>
<thead>
<tr>
<th>Altitude</th>
<th>Main jet</th>
<th>Pilot screw</th>
<th>Jet needle</th>
</tr>
</thead>
<tbody>
<tr>
<td>Below 6,000 ft</td>
<td>No. 95</td>
<td>Factory preset</td>
<td>3rd notch</td>
</tr>
<tr>
<td>Above 5,000 ft</td>
<td>No. 90</td>
<td>Factory preset</td>
<td>2nd notch</td>
</tr>
</tbody>
</table>

Installation: Above 5,000 ft (1,500 m)
1. Turn the fuel valve OFF.
2. Place the carburetor drain tube in a suitable container. Turn the carburetor drain screw counterclockwise and drain the carburetor.

WARNING
* Gasoline is extremely flammable and is explosive under certain conditions. Perform this operation in a well-ventilated area. Do not smoke or allow flames or sparks in the area.
3. Remove the carburetor by removing the nuts. Unscrew the carburetor cap, pull out the throttle valve (3), and remove the carburetor.

4. Remove the float chamber.

5. Remove the standard main jet (1) No. 95, and install the high altitude main jet No. 90 (1). Reinstall the float chamber.

6. Remove the jet needle (2) from the throttle valve (3). Change the position of the E-clip (4) from the 3rd notch to the 2nd notch. Reinstall the jet needle into the throttle valve.

7. Slide the throttle valve into the carburetor and tighten the cap. Install the carburetor. Make sure the drain screw is turned fully clockwise and turn the fuel valve ON.

8. Start the engine. Adjust the idle speed and pilot screw (page 39).

NOTE:
* Adjust the idle speed and pilot screw at low altitude to ensure proper low altitude operation.

Removal: Below 6,000 ft (1,800 m)
1. Follow installation steps 1-4.
2. Reinstall the original No. 95 main jet.
3. Change the jet needle clip back to the 3rd notch.
4. Reinstall the carburetor. Adjust the idle speed and pilot screw (page 39).

NOTE:
* Adjust the idle speed and pilot screw at low altitude to ensure proper low altitude operation.
SPARK PLUG

Standard spark plug
DR8ES-L (NGK), X24ESR-U (ND)

CAUTION:

* The use of spark plugs of incorrect size or heat range can cause serious engine damage.

1. Disconnect the spark plug cap.
2. Clean any dirt from around the spark plug base.
3. Remove the plug with the wrench provided in the tool kit.
4. Visually inspect the spark plug electrodes for wear. The center electrode should have square edges and the side electrode should not be eroded. If the electrodes and insulator tip appear unusually fouled or burned, we suggest that you contact an authorized Honda dealer for inspection of the ATC. Discard the spark plug if there is apparent wear or if the insulator is cracked or chipped.
5. Make sure that the spark plug gap is 0.6–0.7 mm (0.024–0.028 in) using a wire-type feeler gauge. If adjustment is necessary, bend the side electrode (1) carefully.

6. With the plug washer attached, thread the spark plug in by hand to prevent cross-threading.
7. Tighten a new spark plug 1/2 turn with the spark plug wrench to compress the washer. If you are reusing a plug, it should only take 1/8–1/4 turn after the plug seats.

CAUTION:

* The spark plug must be securely tightened. An improperly tightened plug can become very hot and possibly damage the engine.

(1) Side electrode

0.6–0.7mm
(0.024–0.028 in)
AIR CLEANER

The air cleaner element accumulates dust and must be cleaned periodically. If the ATC200M is ridden in dusty areas, the element must be cleaned at more frequent intervals than specified in the MAINTENANCE SCHEDULE.

To clean the filter element:
1. Remove the seat by pulling the lever (1).
2. Remove the four wing nuts (2) attaching the air cleaner case.
3. Pull out the retainer clip and remove the air cleaner assembly from the frame.
4. Remove the filter element (3), wash it in non-flammable or high flash point solvent and allow it to dry thoroughly.

WARNING

* Never use gasoline or low flash point solvents for cleaning the air cleaner element. A fire or explosion could result.

5. Soak the filter element in clean gear oil (SAE 80–SAE90) until saturated, then squeeze the element several times and throw the excess oil.
6. Reassemble by reversing the disassembly sequence.

CAUTION:

* Do not twist the filter element when squeezing the filter element.
VALVES

Valve clearance should be maintained at 0.05 mm (0.002 in). Excessive clearance will cause noise. Insufficient clearance will cause loss of power and could cause valve damage.

NOTE:
* Check and adjust valve clearances while the engine is cold. The clearance will change as the temperature rises.

1. Remove the timing mark cover and valve adjusting caps.

2. Using the recoil starter, rotate the alternator rotor counterclockwise until the T mark (1) on the alternator rotor lines up with the timing index mark (2) on the cover. In this position, the piston may either be on the compression or the exhaust stroke. The adjustment must be made when the piston is on top of the compression stroke and both the intake and exhaust valves are closed. This can be determined by moving the rocker arms by hand. If they are free, it is an indication that the valves are closed and that the piston is on the compression stroke. If they are tight and the valves are open, rotate the alternator rotor 360° (one complete revolution) and realign the T mark to the timing index mark.

3. Check the clearance of both valves by inserting a 0.05 mm (0.002 in) feeler gauge (5) between the adjusting screw and valve stem.
4. If adjustment is necessary, loosen the adjusting screw lock nut (3) and turn the screw (4) so that there is a slight resistance when the feeler gauge (5) is inserted.

5. After adjustment, tighten the lock nut while holding the adjusting screw to prevent it from turning.

6. Recheck the clearance to make sure that it has not changed.

7. Reinstall the timing mark cover and valve adjusting caps.

(3) Lock nut  (5) Feeler gauge
(4) Adjusting screw
CLUTCH

1. Make sure the ignition switch is OFF.
2. Loosen the lock nut (1), and turn the clutch adjuster (2) counterclockwise until you feel resistance. Then turn 1/4 turn clockwise, and tighten the lock nut to hold the adjuster in this position.
3. After adjustment, start the engine and test ride the ATC to be certain that the clutch is operating properly.
BRAKES

Front Brake Lever

Measure the distance the brake lever moves before the brake starts to take hold.
Free play, measured at the tip of the front brake lever (1), should be within 15–20 mm (5/8–3/4 in.).
Minor adjustments can be made with the cable adjuster (2) on the front brake lever. Loosen the lock nut (3) and turn the front brake cable adjuster (2).
Major adjustment should be made using the lower adjuster (4).

NOTE:
* Make sure the cut-out on the adjusting nut (4) is seated on the brake arm pin

Other Checks:
Check the brake cable for kinks or signs of wear that could cause sticking or failure. Lubricate the brake cable with a commercially available cable lubricant to prevent premature wear and corrosion.
Make sure the brake arm, spring, and fasteners are in good condition.

Wear Indicator:
When the brake is applied, an arrow (5) attached to the brake arm (6) moves toward a reference mark (7) on the brake panel.
If the arrow aligns with the reference mark on full application of the brake, the brake shoes must be replaced. See your authorized Honda dealer for this service.
Rear Brake Pedal

Measure the distance the rear brake pedal moves before the brake starts to take hold.
Free play, measured at the end of the pedal (1), should be 15–20 mm (5/8–3/4 in.).
Adjust by turning the brake pedal adjusting nut (2) located on the brake operating rod at the rear of the frame.

**NOTE:**
* Make sure the cut-out on the adjusting nut is seated on the brake arm pin.

Other Checks:
Check the brake cable for kinks or signs of wear that could cause sticking or failure. Lubricate the brake cable with a commercially available cable lubricant to prevent premature wear and corrosion.
Make sure the brake arm, spring, and fasteners are in good condition.

(1) Rear brake pedal

(2) Brake pedal adjusting nut

(3) Brake lever adjusting nut
Rear Brake Lever/Parking Brake

Measure the distance the rear brake lever moves before the brake starts to take hold.
Free play, measured at the tip of the brake lever (4), should be within 15–20 mm (5/8–3/4 in). Minor adjustments can be made with the cable adjuster (6) on the front brake lever. Loosen the lock nut (5) and turn the front brake cable adjuster (6). Major adjustments should be made using the lower adjuster (7) located on the brake arm (8).

Other Checks:
Check the brake cable for kinks or signs of wear that could cause sticking or failure. Lubricate the brake cable with a commercially available cable lubricant to prevent wear and corrosion. Make sure the brake arm, spring, and fasteners are in good condition.

Wear Indicator:
When the brake is applied, an arrow (9), attached to the brake arm (8), moves toward a reference mark (10) on the brake panel. If the arrow aligns with the reference mark on full application of the brake, the brake shoes must be replaced. See your authorized Honda dealer for this service.
THROTTLE CABLE

Inspect the throttle cable for condition and operation. Replace the cable if it has become worn or kinked. Lubricate the cable with a commercially available cable lubricant to prevent premature wear and corrosion. Free play, measured at the tip of the throttle lever (1), should be maintained at 5–10 mm (3/16–3/8 in).

The cable adjuster (3) is located on top of the carburetor. Slide the rubber sleeve (2) back to expose the throttle cable adjuster (3). Turn the adjuster to obtain the correct free play. Reinstall the sleeve after adjustment.

(1) Throttle lever

(2) Rubber sleeve
(3) Cable adjuster

(A) Increase free play
(B) Decrease free play
**DRIVE CHAIN**

The drive chain (1) will wear with use and requires periodic adjustment in accordance with the maintenance schedule. Shut the engine off. Remove the inspection cap (2). Chain slack should be checked by measuring the amount of chain slack through the inspection hole. The amount of slack should be 10–20 mm (3/8–3/4 in.). To adjust slack, loosen the rear wheel hub fixing bolts (4). Turn the adjusting nut (5) to decrease or increase chain slack. Retighten the rear wheel hub fixing bolts and reinstall the cap.

**Lubrication:**

Lubricate the drive chain through the lubrication hole by removing the lubrication cap (3). This hole is capped to prevent dirt from entering the chain case. Be sure to reinstall the cap after lubrication.

**NOTE:**

* The O-ring in this chain can be damaged by steam cleaning or by high pressure washers. Lubricate the chain only with SAE 80 or 90 gear oil. Commercial chain lubricants may contain certain solvents which could damage the rubber O-rings.

![Drive chain images](image_url)
CAM CHAIN
An improperly adjusted cam chain will adversely affect engine performance. The cam chain will rattle and be noisy if it needs a tension adjustment.

To adjust the cam chain:
1. Start the engine and let it idle.
2. Remove the rubber cap (1) and loosen the tensioner adjusting bolt (2).
   When it is loosened, the cam chain tensioner will automatically position itself to provide the correct cam chain tension.
3. Retighten the tensioner adjusting bolt and install the rubber cap.

NOTE:
* Do not attempt to loosen the 6mm bolt (3) while adjusting.

(1) Rubber cap
(2) Tensioner adjusting bolt
(3) 6mm bolt
(A) Loosen to adjust
(B) Tighten
BATTERY

If the ATC200M is operated with insufficient battery electrolyte, sulfation and battery plate damage will occur. If rapid loss of electrolyte is experienced, or if your battery seems to be weak, causing slow starting or other electrical problems, see your authorized Honda dealer.

Battery electrolyte:
The battery (1) is under the seat. Remove the seat by pulling the seat lever. The electrolyte level must be maintained between the upper (4) and lower (5) marks on the side of the battery. If the electrolyte level is near the lower level mark, remove the battery filler caps (2), and carefully add distilled water to the upper level mark, using a small plastic tunnel or syringe.

CAUTION:
* When checking battery electrolyte level or adding distilled water, make sure the breather tube is connected to the battery breather outlet (3).

NOTE:
* Use only distilled water in the battery. Tap water may shorten the service life of the battery.

![Battery components diagram]

(1) Battery  
(2) Battery filler caps  
(3) Battery breather outlet  
(4) Upper level mark  
(5) Lower level mark
WARNING

* The battery contains sulfuric acid. Avoid contact with skin, eyes or clothing. Antidote: EXTERNAL-Flush with water. INTERNAL-Drink large quantities of water or milk. Follow with milk of magnesia, beaten egg or vegetable oil. Call physician immediately. Eyes: Flush with water and get prompt medical attention.

* Batteries produce explosive gases. Keep sparks, flames and cigarettes away. Ventilate when charging or using in enclosed spaces. Always shield eyes when working near batteries.

* KEEP OUT OF REACH OF CHILDREN.

CAUTION:

* The battery breather tube must be routed as shown on the label. Do not bend or twist the breather tube. A bent or kinked breather tube may pressurize the battery and damage its case.
SPARK ARRESTER

The exhaust system must be periodically purged of accumulated carbon.
1. Remove the spark arrester bolts (1) and slide the arrester (2) out.

⚠️ WARNING

* The exhaust system becomes VERY HOT even after short periods of engine operation.

2. Clean the arrester of accumulated carbon.

3. Start the engine and purge accumulated carbon from the system by momentarily revving up the engine several times.

⚠️ WARNING

* To avoid fire hazards, DO NOT perform this maintenance in the vicinity of flammable materials.

4. Stop the engine and allow the exhaust pipe to cool.
5. Reinstall the spark arrester with the bolts.

(1) Spark arrester bolts  (2) Spark arrester
STORAGE

Extended storage, such as for winter, requires that you take certain steps to reduce the effects of deterioration from non-use of the ATC. In addition, necessary repairs should be made BEFORE storing the ATC; otherwise, these repairs may be forgotten by the time the ATC is removed from storage.

1. Change the engine oil and clean the oil filter screen and the oil filter rotor.
2. Lubricate the drive chain.
3. Drain the fuel tank and carburetor. Spray the inside of the tank with an aerosol rust-inhibiting oil. Reinstall the fuel cap on the tank.

⚠️ WARNING

* Gasoline is flammable and is explosive under certain conditions. Do not smoke or allow flames or sparks near the equipment while draining fuel.

4. Remove the spark plug and pour a tablespoon (15–20 cc) of clean engine oil into the cylinder. Operate the starter for a few seconds to distribute the oil, then reinstall the spark plug.

NOTE:

* When turning the engine over, the Engine Stop Switch should be OFF and the spark plug placed in its cable cap and grounded to prevent damage to the ignition system.

5. Remove the battery. Store in an area protected from freezing temperatures and direct sunlight. Check the electrolyte level and slow charge the battery once a month.

6. Wash and dry the ATC. Wax all painted surfaces.
7. Inflate the tires to their recommended pressures. Place the ATC on blocks to raise both tires off the ground.
8. Cover the ATC (don’t use plastic or other coated materials) and store in an unheated area, free of dampness with a minimum of daily temperature variation. Do not store the ATC in direct sunlight.

REMOVAL FROM STORAGE
1. Uncover and clean the ATC. Change the engine oil if more than 4 months have passed since the start of storage.
2. Check the battery electrolyte level and charge the battery as required. Install the battery.
3. Drain any excess aerosol rust-inhibiting oil from the fuel tank. Fill the fuel tank with fresh gasoline.
4. Perform all Pre-ride Inspection checks (page 19). Test ride the ATC at low speeds in a safe riding area.
1. Turn the fuel tank cap lever and fuel valve OFF.
2. Place the carburetor drain tube in a suitable container.
3. Turn the drain screw counterclockwise to drain the gasoline from the carburetor.

**WARNING**

* Gasoline is flammable and is explosive under certain condition. Do not smoke or allow flames or sparks near the equipment while draining fuel.

* Never incline the machine with the front wheel up, or rest it on its side without draining the fuel and removing the battery. Fuel vapor or spilled fuel may ignite and the battery may leak electrolyte.

4. After draining turn the drain screw clockwise until tight.

**NOTE:**

* Be sure the fuel drain is closed (screw turned clockwise) before refueling the ATC.
* It is not necessary to drain the engine oil from the crankcase, as no appreciable oil leakage will occur when the ATC is rested on its side.

5. Remove the battery, disconnecting the negative (—) terminal first, then the positive (+) terminal. When reinstalling the battery, connect the positive (+) terminal first, then the negative (—).

6. If wheel removal is required when transporting, follow the procedures on the following pages.
Front Wheel Removal

1. Place a support block under the engine to raise the front wheel off the ground.
2. Remove the front brake adjusting nut (1) and disconnect the front brake cable.
3. Loosen the axle holder nuts (2) and remove the axle (3).
4. Remove the axle collar and front wheel.

NOTE:
* Cover the wheel hub as soon as the axle has been removed to prevent the entry of dirt.
Installation

1. Install the axle holder with the UP mark (4) facing upwards. Install the axle holder nuts (5). Do not tighten them at this time.

2. Install the front wheel between the front forks aligning the tab on the brake panel with the hole in the right front fork.

3. Install the axle collar and insert the front axle through the left front fork, collar, front wheel and front brake panel.

4. Tighten the axle to 70–110 N·m (7.0–11.0 kg-m, 50–80 ft-lb) torque.

5. Tighten the axle holder nuts to 10–14 N·m (1.0–1.4 kg-m, 7–10 ft-lb) torque.

6. Install the front brake cable and adjust the brake free play.

⚠️ WARNING

* If a torque wrench was not used for installation, see your dealer as soon as possible to verify proper assembly.
Rear Wheel Removal

1. Place a support block under the vehicle and raise the rear wheel off the ground.
2. Loosen the wheel nuts (1) with a 12 mm socket wrench.
3. Remove the wheel.

Installation Notes:

Reinstall the rear wheels and tighten the wheel nuts (1) in a cross pattern to 20–25 N·m (2.0–2.5 kg·m, 14–18 ft·lb).

WARNING

* If a torque wrench was not used for installation, see your dealer as soon as possible to verify proper assembly.
TAMPERING WITH THE NOISE CONTROL SYSTEM IS PROHIBITED: Federal law prohibits the following acts or the causing thereof: (1) The removal or rendering inoperative by any person, other than for purposes of maintenance, repair, or replacement, of any device or element of design incorporated into any new vehicle for the purpose of noise control prior to its sale or delivery to the ultimate purchaser or while it is in use; or (2) the use of the vehicle after such device or element of design has been removed or rendered inoperative by any person.

AMONG THOSE ACTS PRESUMED TO CONSTITUTE TAMPERING ARE THE ACTS LISTED BELOW:

1. Removal of, or puncturing the muffler, bafflers, header pipes or any other component which conducts exhaust gases.
2. Removal of, or puncturing of any part of the intake system.
3. Lack of proper maintenance.
4. Replacing any moving parts of the vehicle, or parts of the exhaust or intake system, with parts other than those specified by the manufacturer.

**WARNING**

* Load cargo on the rear carrier as far forward as possible. Do not allow cargo to extend beyond the end of the rear carrier.
* When towing a trailer, care should be taken to maintain balance and stability. Place cargo on the trailer so that it will not cause the front wheel to lift off the ground during travel.
* To prevent an accident, use extreme care when adding or riding with accessories and cargo. Addition of accessories and cargo can reduce the ATC’s stability, performance and safe operating speed. Accessories are designed for work applications and should be removed for recreational riding.

Front Carrier
Maximum Load 10 kg (22 lbs)

Rear Carrier
Maximum Load 25 kg (55 lbs)

Trailer Hitch
Trailer Maximum weight (with load) 228 kg (500 lbs)

To install the optional parts, follow the instructions furnished with the parts.
Owner Satisfaction

Your satisfaction and goodwill are important to your distributor. The details of warranty are explained in the Distributor’s Limited Warranty. Normally, all warranty repairs on the product can be handled by your dealer’s service department. Sometimes, however, in spite of the best intentions, misunderstandings can occur. If your problem has not been handled to your satisfaction, or if you take the following action:

- Discuss your problem with a member of dealership management. Often, complaints can be quickly resolved at that level if the problem has already been reviewed by the service manager or the owner of the dealership or the General Manager.
- If your problem still has not been resolved to your satisfaction, contact the Honda Tractor and Power Products Customer Relations Department at the regional general office of Honda Motor Co., Inc. in your area. Regional office locations are shown on the back of this booklet. Please provide the following information in order to assist you:
  - Your name, address, and telephone number
  - Product model and serial number
  - Date of purchase
  - Dealer name and address
  - Nature of the problem

After reviewing all the facts involved, you will be advised of your next step in mind that your problem will likely be resolved at the dealer level, so it is very important that your initial contact be with your dealer. Your purchase of a Honda product is greatly appreciated. We want to assist you in every way possible.
