

Whole Genome Sequencing DNA Applications

With Whole Genome Sequencing (WGS), the genetic variations present in all of your 30,000 genes is uncovered. Typically, most of your genes will be normal however, some genes will carry mutations that could cause disease or contribute to future disease development. In addition, information will also be available help determine the potential gene inheritance by your children. A DNA analysis application (An app), is a computer program that looks at how your specific genetic variants may impact a health-related area of interest. You will need to pay the app developer a fee to use their analysis program. This is a list of some DNA apps (and fees) available through Sequencing.com. If your WGS was done by Dante Labs or Nebula Genomics, your DNA sequencing data can be up-loaded into any app for analysis.
