

Women Absorb And Retain Male DNA From Sperm

A scientific study has shown that females retain and carry **MALE DNA** from every sexual encounter with men, this is according to a new study by the University of Seattle and the Fred Hutchinson Cancer Research Center.

The **study**, which found these facts accidentally, was originally trying to find out if women who were pregnant with a boy might be more susceptible to certain neurological conditions that occur more frequently in men.

But during their research on the female brain, the study began to uncover other fascinating facts.

The study discovered that female brains often contain “**male microchimerism**”, or to put it simply, **MALE DNA** that must have come from another person, and are genetically different from the rest of the woman.

The study claims that: “*63% of the females (37 of 59) tested harbored male microchimerism in the brain. Male microchimerisms were present in multiple brain regions.*”

It turns out that 63% of women carry male DNA in their brains. Of course, the researchers wanted to know where the male DNA originated from.

Take a guess. From the women's fathers? No. A woman's father's DNA combines with their mother's to create a unique DNA. So where else did it come from?

Initially, the researchers thought that all male DNA found living in the female brain came from a male pregnancy. That was the safe, and politically correct conclusion. But these researchers were completely wrong.

When they autopsied the brain tissues of women who were never pregnant, let alone with a male baby, they STILL discovered male DNA cells present in the female brains.

This is when the scientists didn't know what was actually happening. They tried to put the entire research study on hold until they could better understand it but the answer was already there.

What were they so scared of?

“CONCLUSIONS: Male microchimerism was not infrequent in women without sons. Besides known pregnancies, other possible sources of male microchimerism include unrecognized spontaneous abortion, vanished male twin, an older brother transferred by the maternal circulation, or SEXUAL INTERCOURSE. Male microchimerism was significantly more frequent and levels were higher in women with induced abortion than in women with other pregnancy histories. Further studies are needed to determine specific origins of male microchimerism in women.”

Basically, according to the scientists, the likely sources of the male DNA inside women's brains come from:

1. An unrecognized abortion
2. A male twin that disappeared
3. An older brother transferred by the maternal circulation
4. Sexual intercourse with a man

If you look at the fact that a huge **63% of women** have male DNA cells in the recesses of their brain, which explanation do you think is the one that fits the most?

When you think about it, the first three options can only apply to a small number of women. You can't possibly apply it for the 63% figure. The fourth option however, well it's a lot more common

The answer is actually: 4. Sex.

And it comes with **VERY SERIOUS CONSEQUENCES** for women.

Whenever a woman has **unprotected sex** with a man, she absorbs the sperm and the sperm becomes a living part of her for life. The research was based on women that were elderly. Many of these women had been carrying the living male DNA inside their brains for over 50 years.

What you need to understand is that sperm is a living organism and there are between **40 million and 1.2 billion sperm cells** in a single ejaculation.

When sperm goes inside a woman, it swims until it crashes into a wall, and then it burrows into the woman's flesh. If it happens inside a mouth the sperm swims and climbs into nasal passages, inner ear, and behind the eyes. And it stays there. It also enters the brain and spine.

Just like out of some sci-fi horror film, all the sexual partners the woman goes through become a part of her and **she can't get rid of their DNA.**

This is one of the reasons when **women are promiscuous** and have many sexual partners, they are highly unlikely to pair bond and find someone to build a long lasting relationship with for life.

Science is only now starting to understand why having **MULTIPLE SEXUAL PARTNERS** for women is **DETRIMENTAL** for them in every way.

Your fiend,

Alex
