OutcomeCatalyst

Self-Service Data Discovery for Investment Teams

Reduce the time to analyze your investment thesis by up to 90%

Investment teams regularly acquire and analyze both internal and external data assets. Traditionally, manually extracting data from sources such as SFTP, SQL Server, and cloud storage, then cleansing and preparing it for analysis, can take days or even weeks, delaying validation of investment thesis.

Our self-service data discovery framework streamlines this process, preparing and aggregating all data assets with built-in governance and compliance. This enables investment teams to validate their investment thesis in hours or less, significantly accelerating decision-making.

Deliverables

Data Assets
Set of standardized, governed data assets for all data vendors across the firm with role-based access controls

Unified Data Platform
Automate and streamline the ingestion and transformation of data, providing a single source of truth for investment teams

Machine Learning Operations
Scalable infrastructure that manages ML model lifecycle: development, deployment, and versioning to enable advanced analytics

Outcomes

Increase business productivity by 500%+

Investment teams no longer need to cleanse and prepare data assets, reducing their time to validate investment decisions by up to 90%

Ensure security & compliance

Mapping data assets to role-based access controls secures your sensitive information and ensures compliance with regulatory requirements

Increase alpha

Return time back to your quants and analysts, allowing them to focus more time on new investment ideas
