

Creating a frequency table from data already given in table, then answering questions about it

Wolverine's Table

Fill in the blanks in Wolverine's two-way table of the people he knows:

| | Mutant | Human | Alien | Total |
|-------|--------|-------|-------|-------|
| Good | | 43 | | 72 |
| Bad | 84 | | 35 | |
| Total | 111 | 52 | | 200 |

Use the table to answer the questions.

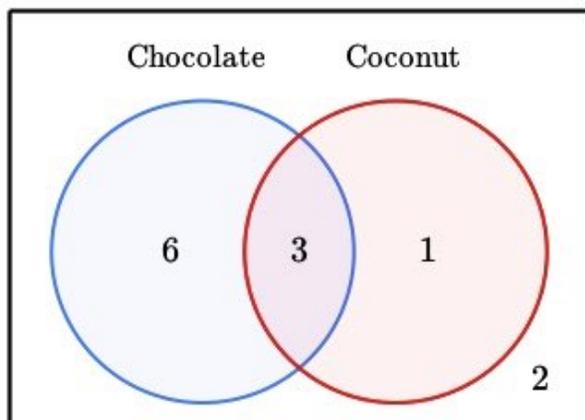

1. What is the probability of picking a mutant at random from the people Wolverine knows?
 2. What's the probability of picking a good human?
 3. What is the probability of picking someone who is bad?
- Challenge:*
4. Which category of individual has a 1% chance of being selected?

Creating a frequency table from a Venn Diagram

Forest has a box of 12 candies. The Venn diagram below shows how many candies contain chocolate, coconut, both, or neither.

Complete the following two-way frequency table.

| | Contain coconut | Do not contain coconut |
|--------------------------|----------------------|------------------------|
| Contain chocolate | <input type="text"/> | <input type="text"/> |
| Do not contain chocolate | <input type="text"/> | <input type="text"/> |

Creating a frequency table from some observations

Nikita knows the following information about her food club that has 11 members:

- 3 members like neither fruit nor vegetables.
- 4 members like fruit but not vegetables.
- 5 members in total like fruit.

Can you help Nikita organize the results into a two-way frequency table?

| | Like fruit | Do not like fruit |
|------------------------|----------------------|----------------------|
| Like vegetables | <input type="text"/> | <input type="text"/> |
| Do not like vegetables | <input type="text"/> | <input type="text"/> |

Creating a Relative Frequency Table (for the whole table) from a Two Way Frequency Table

Creating a **Relative Frequency** table based on TOTAL people.

Below is a table of people in the park and the activities that they do. Complete the frequency table below, based on the total participants. First, complete the table.

| Activity | Jog | Fly Kites | Picnic | Total |
|----------|-----|-----------|--------|-------|
| Male | 9 | 4 | 10 | |
| Female | 11 | 1 | | |
| Total | | | 25 | 50 |

To create a relative-frequency two-way table for **all 50 people**, divide each number in each cell by 50

| Topping | Jog | Fly Kites | Picnic | Total |
|---------|-----|-----------|--------|-------|
| Male | | | | |
| Female | | | | |
| Total | | | | |

Fifty students in the 8th grade class were asked what kind of ice-cream they like (vanilla or chocolate) and what kind of toppings they like (sprinkles, m & m's, or nothing). Identify any trends in the data.

| Topping | Sprinkles | m & m's | Nothing | Total |
|-----------|-----------|---------|---------|-------|
| Vanilla | 9 | 8 | 13 | 30 |
| Chocolate | 7 | 9 | 4 | 20 |
| Total | 16 | 17 | 17 | 50 |

To create a relative-frequency two way table with **percents**, use the total number of students.

| Topping | Sprinkles | m & m's | Nothing | Total |
|-----------|-----------|---------|---------|-------|
| Vanilla | | | | |
| Chocolate | | | | |
| Total | | | | |

This will answer the following questions. (State the Percents.)

$$P(\text{Vanilla and Sprinkles}) = \underline{\hspace{2cm}}$$

$$P(\text{Chocolate and Sprinkles}) = \underline{\hspace{2cm}}$$

$$P(\text{Vanilla and m \& m's}) = \underline{\hspace{2cm}}$$

$$P(\text{Chocolate and m \& m's}) = \underline{\hspace{2cm}}$$

$$P(\text{Vanilla and Nothing}) = \underline{\hspace{2cm}}$$

$$P(\text{Chocolate and Nothing}) = \underline{\hspace{2cm}}$$

To create a relative-frequency two way table for the **rows**, divide each number in each row by the total in that row.

| Topping | Sprinkles | m & m's | Nothing | Total |
|-----------|-----------|---------|---------|-------|
| Vanilla | | | | |
| Chocolate | | | | |

This will answer the following questions. (State the Percents.)

$$P(\text{Sprinkles given Vanilla}) = \underline{\hspace{2cm}}$$

$$P(\text{Sprinkles given Chocolate}) = \underline{\hspace{2cm}}$$

$$P(\text{m \& m's given Vanilla}) = \underline{\hspace{2cm}}$$

$$P(\text{m \& m's given Chocolate}) = \underline{\hspace{2cm}}$$

$$P(\text{Nothing Given Vanilla}) = \underline{\hspace{2cm}}$$

$$P(\text{Nothing given Chocolate}) = \underline{\hspace{2cm}}$$

To create a relative-frequency two way table for the **columns**, divide each number in each column by the total in that column.

| Topping | Sprinkles | m & m's | Nothing |
|-----------|-----------|---------|---------|
| Vanilla | | | |
| Chocolate | | | |
| Total | | | |

This will answer the following questions. (State the Percents.)

$$P(\text{Vanilla given Sprinkles}) = \underline{\hspace{2cm}}$$

$$P(\text{Chocolate given Sprinkles}) = \underline{\hspace{2cm}}$$

$$P(\text{Vanilla given m \& m's}) = \underline{\hspace{2cm}}$$

$$P(\text{Chocolate given m \& m's}) = \underline{\hspace{2cm}}$$

$$P(\text{Vanilla given Nothing}) = \underline{\hspace{2cm}}$$

$$P(\text{Chocolate given Nothing}) = \underline{\hspace{2cm}}$$
