TADPOLE SEALS

Our resilient tadpole seals are well suited for applications that require sealing under pressure. When pressure is applied to the bulb of the tadpole, our seals work to conform to the most uneven of surfaces. Our seals are made to have a very high density, which stops airflow and any other compression damages associated with metal to metal contact.

KEY FEATURES:

- Prevents metal to metal contact
- Reduces compression damages
- Prevents against abrasion
- Blocks airflow
