Approaching Cancer and Treatments with an Open Mind?

Can It Be Done?

August 31, 2026

In the 21st century, western medicine/the medical community are still chopping people up to “cure” diseases. The same mentality was used 100 years ago and although technology (diagnostic machines) is better at identifying cancers, the answer is still: Cut it out, give the patient some poison, aka chemo, radiation and some pills and hope for the best. THAT IS MEDIEVAL THINKING. WHY! IT IS ABOUT THE MONEY!! With few exceptions, an open mind is not a reality in the medical community.

How do we, patients and family, turn a sinking battleship, aka the medical industrial complex? You first stop the sinking! Sinking is close-minded thinking. Next, put new leaders in charge and go right full rudder! The medical community inclusive of big pharma, PBM and hospitals that accept payola for pushing drugs, are all self-licking ice cream cones including freshly minted doctors who are taught nothing about integrative medicine and only know the information the medical schools allow into their curriculum. Leadership at some hospitals like Mayo Clinic, John Hopkins have leadership who are allowing integrative medicine to have a role in cancer treatments. It is the leadership at National Cancer Institute and the National Comprehensive Cancer Network and outliers like the Veterans Administration who are too ridged and closed minded on new well documented research and treatments¹. That stovepipe mentality and closed-minded world view must go. It will be the patients who bring about change, and demand answers other than chop it out and give me more pills!

Patients MUST start being their own doctors and develop some level of critical thinking. Do a lot of homework and ask difficult questions. It begins with learning critical thinking. It is a skill most people never develop, a weakness the medical community capitalizes on yet once learned gives you the ammunition AND knowledge to be well informed and NOT BE RUN OVER BY CLOSE MINDED DOCTORS, BIG PHARMA AND PILL PUSHERS. Critical thinking has three important aspects, analyzing competing information, causality, and result.

Importantly, when critical thinking is taught or learned, it does not tell people how to think, it provides a common analytical framework to teach people how to evaluate competing claims and consider tradeoffs.

First, analyzing competing information, theories, opinions or procedures. A person MUST be open-minded to information that may be contrary to what they know, have been told or believe. People then have the skill set, critical thinking, to analyze the contrary information as to its validity, accuracy and truthfulness.

Second, causality² tells us about the influence by which one event, process, state, or subject contributes to the production of another event, process, state, or object where the cause is at least partly responsible for the effect, and the effect is at least partly dependent on the cause. In other words, which policies, methodologies, achieve CERTAIN OR A DESIRED outcome.

Finally, result. Did the process of analyzing the information (critical thinking) reveal new insights, alternative courses of action, and lead to the development of additional questions and research? Did it inform me of alternatives I had not been briefed on or discussed in my treatment plan?

² Causality is an influence by which one event, process, state, or subject contributes to the production of another event, process, state, or object where the cause is at least partly responsible for the effect, and the effect is at least partly dependent on the cause. Wikipedia.

How does this apply to analyzing relevant information that would lead to one’s selected cancer treatment?

The facts and opinions are many regarding cancer identification and treatment. For example, in July of 2026, lesions were discovered on my prostate. The VA could not give me an answer as to how the lesions formed nor if they were benign or malignant. So, a prostate biopsy was conducted that resulted in a Gleason score of 7. The score indicated the presence of cancer. The question still unanswered is how did the lesions form? Obviously, the lesions led to a biopsy, and the biopsy results indicated the lesions were malignant.

The VA’s answer was prostate removal by surgery or arrest the cancer by radiation. The lack of an answer to the development of lesions is an important part of the diagnosis. So, how did your cancer develop? Further the VA was not even willing to discuss well-studied protocols, Ivermectin and Mebendazole, or other protocols practiced by other leading hospitals.

So, in this scenario, the lesions were malignant. Yet the VA wanted to go to radiation or surgery, what I call the chop shop or the zapper and pills without even considering other treatments.

Now the answer that is required is to find out what caused the lesions³. That answer seems to be elusive in an industry focused on treatment of symptoms vs cause. The medical community must learn to identify the cause and treat it to prevent the result. It must also embrace, albeit carefully, alternative and well documented cancer treatments. GET OFF YOUR APATHY AND OUT OF YOUR LIABILITY INSURANCE STRAIGHT JACKET AND HELP PATIENTS WITH NEW PROTOCOLS.

³ Understanding the cause of a lesion is crucial for proper treatment and management. Lesions can develop due to infections, injuries, autoimmune reactions, or abnormal cell growth, and each type requires a different approach. <https://statspecialtyhospital.com/what-is-a-lesion>

This applies to treatments for cancer. Many oncologists and oncology facilities recommend surgery or radiation. In many cases they recommend more pills, as was the case with Karen’s treatment. Many of the treatments or procedures I have since read and validated were NEVER discussed with Karen and me. Further, if you read the book, *The Cancer Revolution* by Dr. Connealy, you too will discover 99% of what is discussed in the book was most likely never discussed with you or your “Team”.

So, where do patients and families proceed from here? This is where critical thinking comes into play. How does a person, and more importantly an oncologist or your team look at treatment(s) without prejudice towards surgery, radiation, or pills? It is rare.

If one purpose of educating oneself is to prepare them to look at alternatives and be their own doctor, then it leads to taking responsibility for their health and ANALYZING AND RESEARCHING any treatments, the medical industrial complex (MIC) recommends for a given ailment, disease, or illness. When we learn critical thinking and apply it, and see its success in our lives, it is then we understand critical thinking and analysis cannot remain peripheral or absent in our thought processes. You must be your own doctor! © and do not drink the pabulum the MIC is pouring into your treatment cup!

I was told by the VA LPN surgery and radiation are the “only cures/treatments” for cancer. I am undecided if she believes that statement or is stating the “company” line. Both those “treatment” options are the path to pain, pills, misery and cancer that returns.

Since Karen’s death from the MIC, I have been on the warpath to find, research, study and share validated alternatives to the chop shop of the medical industry, AND I HAVE and it is called integrative medicine. I have also found people, credible people, who have CURED themselves of various

cancers WITHOUT ONE DROP OF POISON, NOT ONE PILL AND THE MIC WAS NEVER INVOLVED.

Yes, cancer treatment and a plan can be accomplished with a team of people with open minds and sound thought processes. YOU MUST HAVE A TEAM, NOT AN ONCOLOGY TEAM AT A CLINIC OR HOSPITAL, but a team of people including an integrative doctor who will support you in your research, challenge your assumptions and conclusions, force you to seek guidance on your decision and NEVER have a closed mind.

So, the answer to the question at the top of the page is “Yes it can be done!” It requires effort, for you to be your own doctor and never rely on one recommendation for treatment. It requires a team of people including integrative doctors, both MD’s and non-MD’s, nurses, critical thinkers, naturopathic doctors, and lots of brain power. Remember, it is your body the MIC wants to run through the chop shop or radiation mill.
