Short Note: Veterans Administration Recommends Two Treatments for Prostate Cancer? **Why not others?**

BLUF: My consultation with the VA Augusta on 13 August regarding "cures" and "treatments" for prostate cancer was either radiation or surgery. I was informed the VA will not and does not recognize nor recommend other treatments for prostate cancer such as Ivermectin + Mebendazole, high dose vitamin C or Traditional Chinese Medicine. The VA only uses treatment protocols from the National Comprehensive Cancer Network[1], www.NCCN.org organization which are surgery and radiation.

On August 13th, I met with the VA Representative (I think she was an LPN), who reviewed the prostate biopsy results from July 2026. She was very thorough, explained in detail the results of the biopsies with the readings of 4+3 (GG3), 3+4 (GG2), and 3+4 (GG2) on the Gleason scale (her notes on the handout she provided.)

Additionally, we discussed the procedures the VA recommends for this stage/state of prostate cancer, which are surgery or radiation. The VA representative discussed each procedure in detail outlining the risks and side effects of each. She provided written literature on each procedure, showed me where on the NCCN.org website to go for more information. She requested a PSMA-PET scan with a follow up consultation. During the discussion, she said, "There are only to cures for P.C., surgery and radiation." This is when my radar went off; however, I did not interrupt the review or her comments.

At the end of our discussion, I asked her about alternative treatments for this cancer. She reiterated the only procedures (cures/treatment for P.C.) are surgery

[1] The NCCN does not publish a financial report. It receives money from several places/people/organizations. It is linked to the National Cancer Institute, which is a USG funded organization.

and radiation. I introduced her to the book, "*The Cancer Revolution*" by Dr. Connealy, but showed little interest in the details of the book.

Also, there was no interest in other types of testing as I pointed out many other tests noted in the book.

The VA should start looking at new therapies and treatment for prostate cancer. The organization owes it to the Veterans to provide credible information on various treatments for any ailment and not rely on the conclusions of one organization, such as the NCCN.org

Alternative treatments for many cancers are being tested and validated every day in the US, UK and Canada. Integrative medicine is practiced at prestigious medical institutions such as John Hopkins, Mayo Clinic and Duke University Hospital. If these organizations are practicing integrative medicine, that includes non-chemo, non-radiation cancer treatments, why isn't the VA working with them to examine, scrutinize, validate these institution's approach to defeating cancers? Good question. Our veterans should receive the same level of care and information that is available at these institutions.
