BLUF: Dr. Allison discovered that a particular protein (CTLA-4) acts as a braking system, preventing full activation of the immune system when a cancer emerges. By delivering an antibody that blocks that protein, Dr. Allison showed the brakes could be released, thereby allowing the body to use its own capability to fight cancer.

Summary of Nobel Prize for Medicine

NIH grantee wins 2018 Nobel Prize in Physiology or Medicine

"Dr. Allison discovered that a particular protein (CTLA-4) acts as a braking system, preventing full activation of the immune system when a cancer is emerging. By delivering an antibody that blocks that protein, Allison showed the brakes could be released. The discovery has led to important developments in cancer drugs called checkpoint inhibitors and dramatic responses to previously untreatable cancers. Dr. Honjo discovered a protein on immune cells and revealed that it also operates as a brake, but with a different mechanism of action."

To put it into easy-to-understand English: By identifying the protein and how to use its or release its capabilities, the protein's breaks are released thereby allowing the body's immune system to work more directly and aggressively to fight disease.

"The 2018 Nobel Prize in Physiology or Medicine has been awarded to National Institutes of Health grantee James P. Allison, Ph.D., of the University of Texas, M.D. Anderson Cancer Center, Houston, Texas. Dr. Allison shares the prize with Tasuku

Honjo, M.D., Ph.D., of Kyoto University Institute, Japan, for their discovery of cancer therapy by inhibition of negative immune regulation."

"The Royal Swedish Academy of Sciences said, "by stimulating the inherent ability of our immune system to attack tumor cells this year's Nobel Laureates have established an entirely new principle for cancer therapy."

"Jim's work was pivotal for cancer therapy by enlisting our own immune systems to launch an attack on cancer and arrest its development," said NIH Director Francis S. Collins, M.D., Ph.D. "NIH is proud to have supported this groundbreaking research."

"This work has led to remarkably effective, sometime curative, therapy for patients with advanced cancer, who we were previously unable to help," said NCI Director Ned Sharpless, M.D.

These quotes from the NIH, and this breakthrough research, ought to be capturing the attention of thousands of cancer patients and their "doctors," but it does not as it will not generate more pills and profits for big pharma.

Many people, whether doctors, patients, or cancer victims/survivors are slowly learning the body's immune system along with feeding/supporting the immune system can help fight cancer[1].

This information was available in 2017 and published on NIH's website about that time. NOT ONE of Karen's doctors, including Karen's oncologists, Wartofsky and Veytsman, both from the Medstar Wahington Hospital/Oncology, never even mentioned this research.

For the most part, support of the immune system along with specific types of nutrition were never integrated into Karen's treatment plan. There were always more pills, radiation, and chemo – and those were poisons that over time

destroyed Karen’s health, immune system, and the ability of her body to fight infection – i.e. cancer.

The oncology department and Dr. Veytsman never took an integrative approach to treating Karen. There is no record of integrative medicine approach, no written discussion on delivering an antibody that blocks the protein (CTLA-4) thereby helping Karen’s immune system fight cancer. The answer was always more pills. Karen’s team was a failure across many parameters, the least of which was no integrative medical mindset and non-drug programs.

Back to the BLUF: Discuss this protocol with your “Dr.” and listen to either the closed-minded response or the open-minded response, the latter the hallmark and essence of an integrative doctor/practitioner.
