01 Gibberellic Acid & N on Pastures

Nitrogen (N) is a growth multiplier, enhancing the productivity of existing pasture biomass by increasing leaf size. Its effect is maximized when there's already a decent pasture base.

Green feed is cheapest to produce, so do this NOW to increase your feed: about 20kgDM/ha pasture increase per 1kg N if applied right.

Gibberellic acid and nitrogen boost pasture growth when used together during active growth. GA suits cool, moist conditions and works best on grasses, while nitrogen needs warmth and moisture. Apply GA at 2.5–20 g/100 L and nitrogen at 20–60 kg/ha for best results. Further info [LINK](#)

02 Benchmarking 24/25

It's that time of year again! I know most people are still busy with seeding. But for those that have a bit of free time here are the 2024/25 benchmarking forms. Choose between whole farm or just the sheep enterprise benchmarking. **DOWNLOAD** and **SAVE** to your computer prior to editing them, if using the links below.

- BM sheep inputs 24/25 [LINK](#)

03 AWI Feed On Offer Library

Add this tool to your list! AWI's FOO Library is a valuable visual guide to help estimate pasture availability and quality for grazing management. It's a good reminder of how 1000 FOO looks with different species- enough to maintain lambing ewes. [LINK](#)

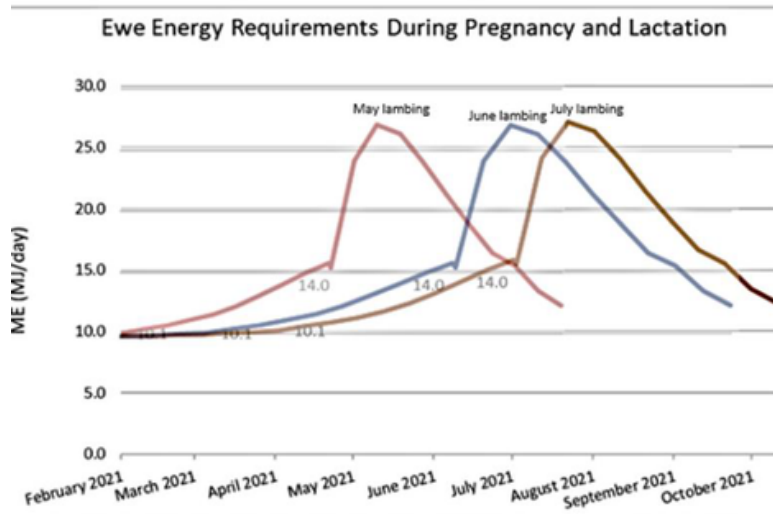

03 Lambing Emergency Kite

- FloPak plus (calcium/glucose)- Hypocalcemia
- Ketol (Propylene Glycol) game changer for preg tox.

As the above issues present the same way, if you are treating a ewe, use both.

- Meloxicam (long-acting anti-inflammatory) can also help. Some AgPro'ers use Buccalgesic instead, as have it on hand.
- Oxytet (antibiotic) on hand year-round for feet, dermo, shearing cuts ect. Also the best for mastitis.
