

Vitamin E Application

2.5 G of Vitamin E per head, do not go below this rate.

Method: Mix 10 kg of product with 20L of water (Quite a difficult job apparently) and apply up the auger. For a 50% active this will apply 5000g of product which will treat 2000 sheep. How much grain to apply this the powder to is dependent upon the feeding rate.

At 250g/hd sheep feed you treat 0.5T of grain with the above formulation

At 500g/hd sheep feed you treat 1.0T of grain with the above formulation

If using this method then it would be best to trail feed in a long line to ensure all sheep in the mob get access to the trail.

The product is Rovimix E50AD.

2.5g/hd of powder. Mix it with feed grains using water, sugar solution, methocell, etc
