Opposites describe two things that are as different from each other as possible but of the same kind. This book looks at animals. Are they up or down? BIG or small? Many or is there just one or two? Identifying more than two things is difficult for toddlers: they see MANY. A two year old can usually understand “one” and “two” things. Even if they are able to count to 10.

Counting is wrote learning and memorising. Children love counting and it is important to get your child used to numbers because this is the building block for mathematics later. Children are usually able to count in order from 1-10 before they understand what those numbers mean.
