

Cooper Discover H/T P245/70R15 Roller Instructions

*Roller instructions

1. Remove all stickers and/or labels from the tire tread area.
2. Put HMS tire conditioner in the roller pan to cover only the tread area of the tire. The tire must be mounted and set to proper air pressure. Try to keep the tire tread area as flat across as possible while treating it.
3. Roll the RS tires first on the machine (if you're using a two tire roller) and then the LS tires. If you are using a two tire roller do all four at the same time.
4. Roll all four tires for 3.5-4 hours race day morning or at most the night before.
5. You will see an 8-12 point drop on the durometer, but it will not last as evaporation is extremely quick with this rubber compound. You need to wait until the last minute if possible.
6. One way to slow down the evaporation is to place the tires in a sealed garbage bag overnight. This slows down the evaporation time dramatically.

Note: We tested this on dirt for performance, but we have never tested its effectiveness on asphalt. This brand of tire and compound are popular for endure type racing. The tire will easily last 150-200 laps depending in the tracks surface.
