## STAR SYSTEM NEURONS

December 6, 2014

[The links to the Nature videos on Laniakea ~ see site.](#)

[Supernova Blasts & Milky Way Mysteries](#) [And the Great Attractor](#)

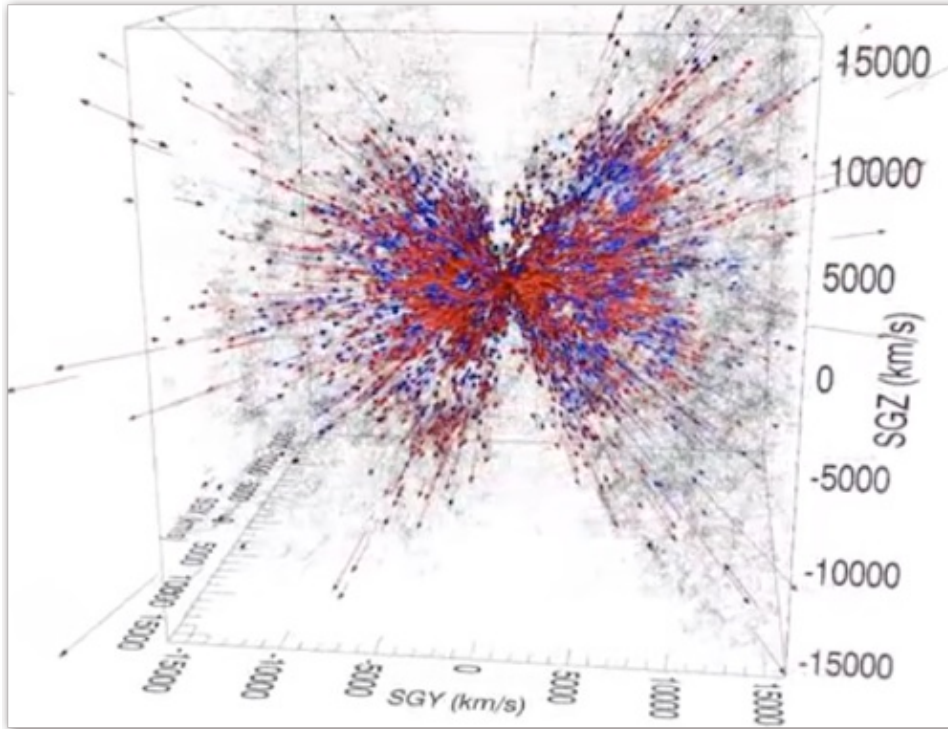

Procyon was an Ancient North Star. South of the ecliptic is Sirius today aligned with Gemini's knee across the Sun from Vega Star system (movie "Contact" first communication).

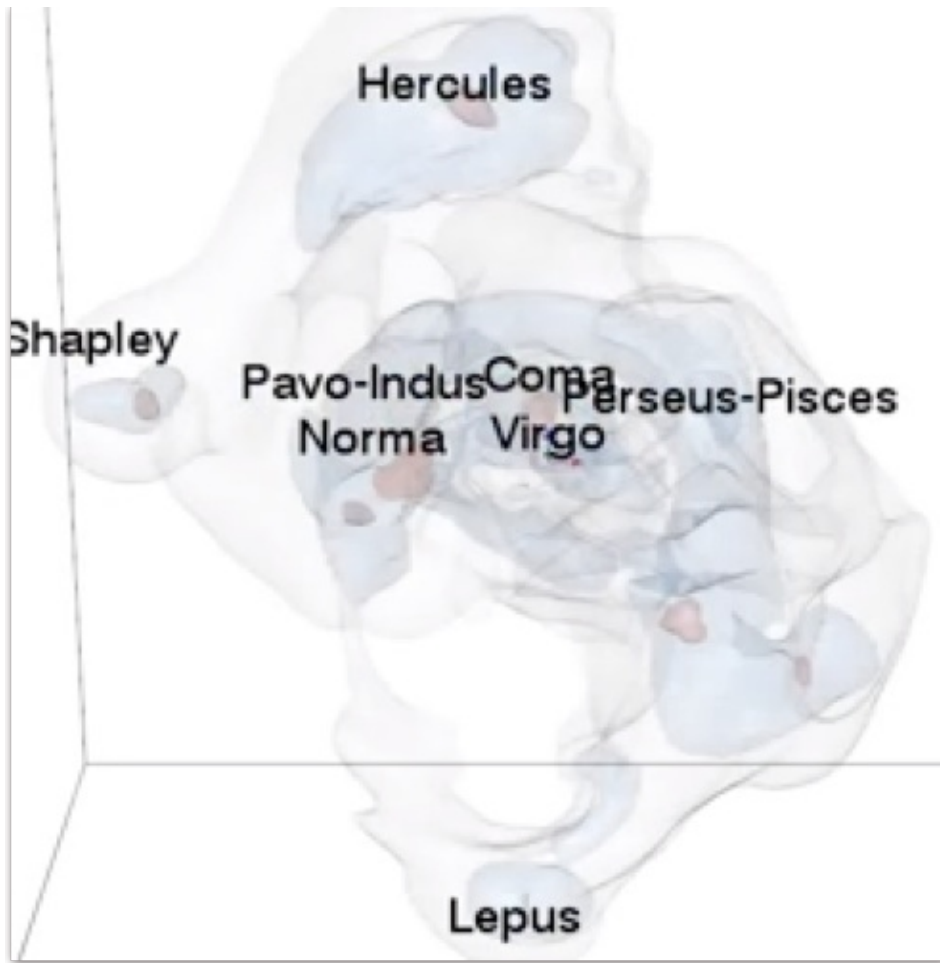

The astronomers work 40 years on this model gathering information and data to map this section of the universe.

Shapley and Lepus- above HERCULES and mid Pisces we are identified among the constellations with Virgo & Coma : Velocity flow lines. Energies from tiny ends go toward the globular cluster in the center.

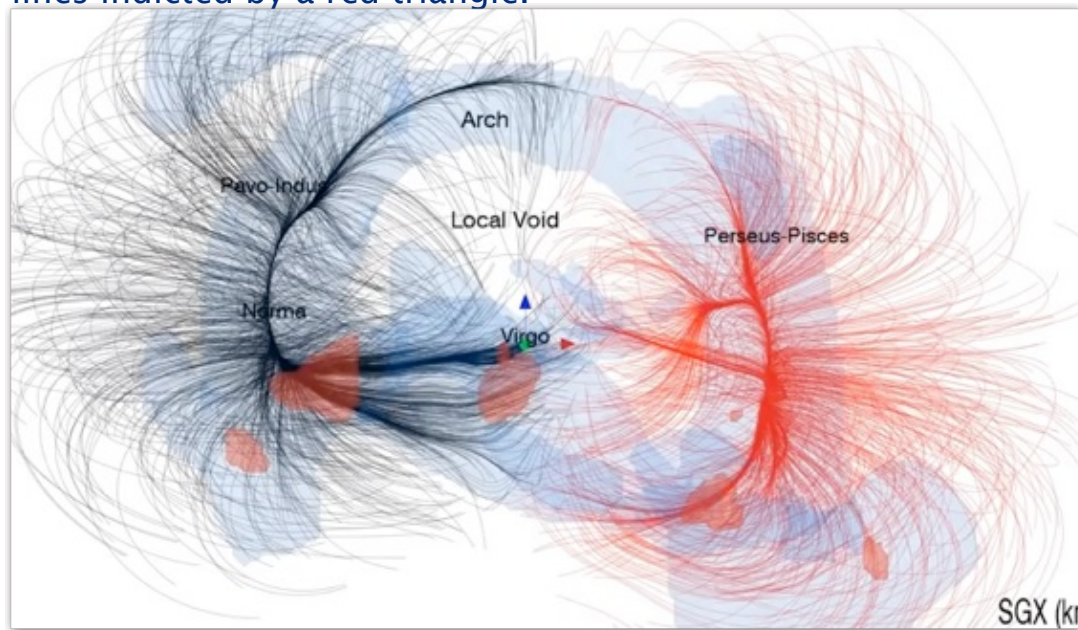

"The Laniakea Supercluster of Galaxies" published in Nature, volume 513, number 7516, p.71 (4 September 2014).

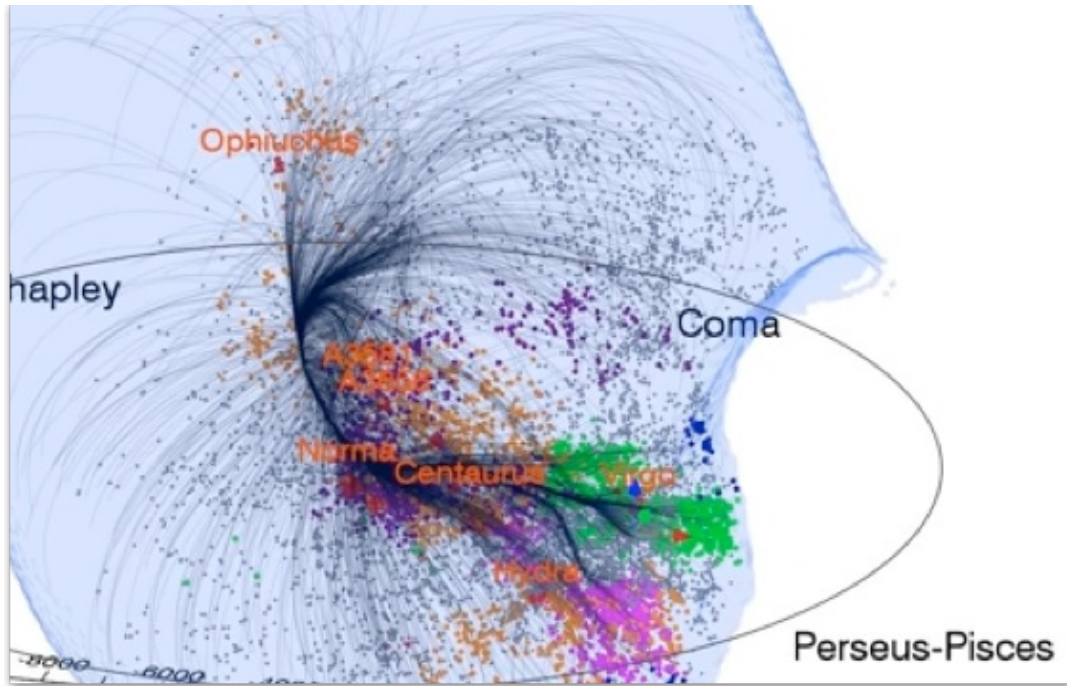

The constellation of Hercules is above Ophis and Serpens. Lepus constellation is the wolf.

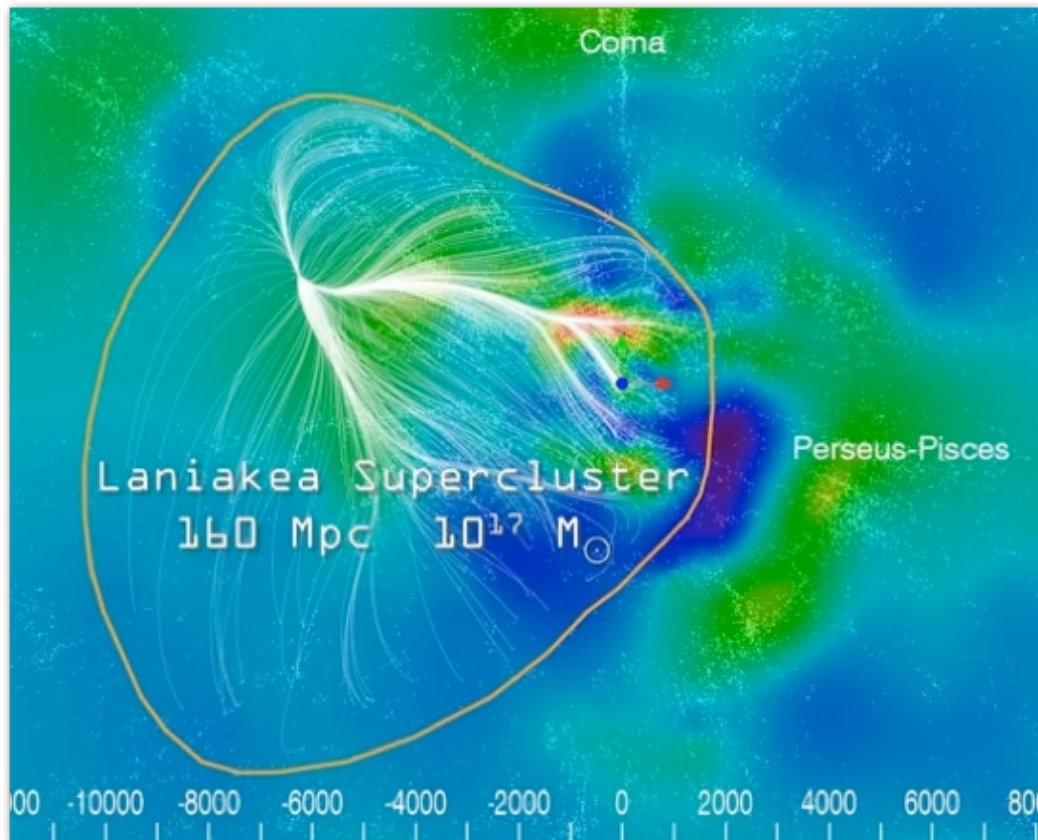

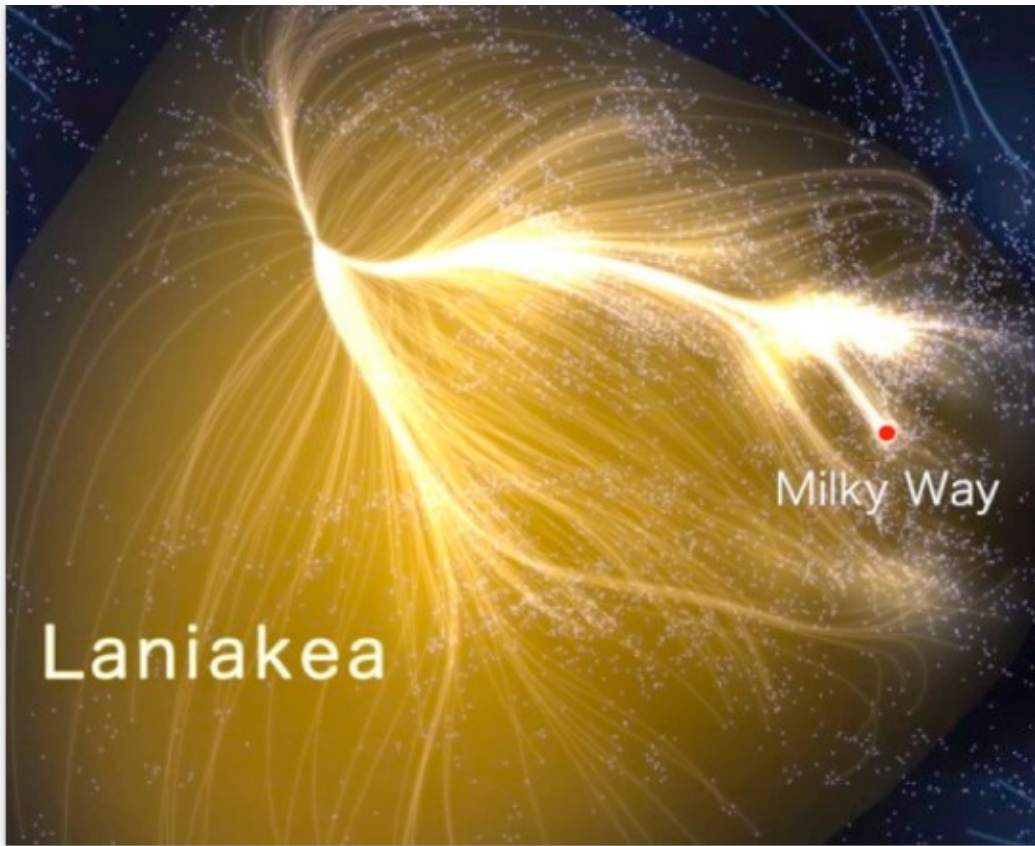

Two energy centers drawing us into its center near Virgo. Our solar system is at the end of the black neuron close to the red lines indicated by a red triangle.

ONce again we see the constellation of Ophiuchus the snake tamer at the top of the black connections with Virgo in green.
