SOL'S PARALLELS

June 10, 2018

**INITIAL PHASES OF A RED GIANT :
COULD THIS BE WHAT OUR SUN IS GOING THROUH, I WONDER?**

As the Sun radiants burst out matter and energy which flows quickly into the planet's poles, it travels directly into the north section of the earth as an "inbreath". It occurs in one straight downward direction, it spins to the center core, and then streams out with an opposite spin on the other end - just like a sparkling light crystal reaction: (two cones in the crystal - narrow to a point) and the energy increases at the point and then the counter spin releases out of the other cone path in a "outbreath" exiting in a clockwise motion.

It is theorized that all luminous objects in space have an heavy core (said to

be iron and to be electromagnetic) as heavier matter sinks. It engages directly with many connections in both planetary bodies and stars. In this early process (as the original core formed) its was actually imprinted in the iron itself from its development, and as a result of its impact - when that same star is near, it responds uniquely to its origin. Could this action be happening with our Sol?

It is highly likely the process transformed our Sun resulting in not only a TWIN, (a binary star) but also a third attachment of creation. A trinary relationship interrupts the normal orbit of a star, altering the dynamics in the vastness of space with special connections. Sol may be drawn to its twin neutron star and yet engaging spontaneously, and simultaneously with the Red Star of its opposite responding in kind, as an "Attractor". Thus allowing Bi-Location. As identical twins can be bilocated ... even a third attractor can arrive being both attractor/repeller. Imagine a potential "tri-local body". Any twin, it is theorized, can be in two places at once by switching to its other self. Imagine being in both places at the same time and being able to flow back and forth effortlessly. However the story darkens with the introduction of this third trinary relationship, the opposite polarity starts a entropic relationship that is out of balance. Just imagine, as it gets closer the Red Star begins to draw in extra material in dimensional fields, stripping the Sun Shine from its outer shell disrupting the orbit along with all its spiraling bodies.

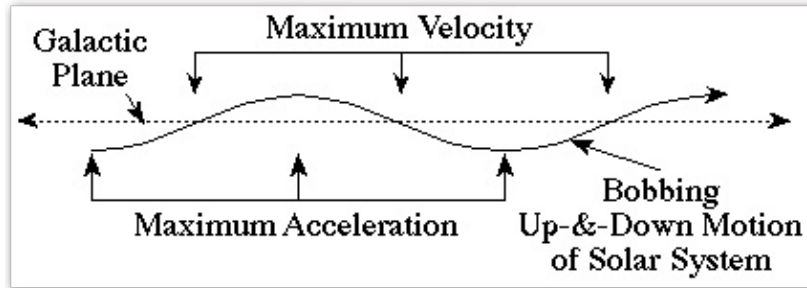

If the sun is triggered to evolve to its next stage (Red Star) many changes would occur in the solar system. If so, we might see on earth ~a dusty, haze cloudy substance would escape from the Sun, bolts of plasma, wriggling oblong material in the sky, & X-ray lambent beams escaping, and this would envelop the earth or any planetary body exterior reacting to the chemical changes within its own atmosphere causing gaseous reactions/imbances (potential explosions of mixtures) and visible odd shapes of floating material transforming their normal states.

How do these parallels react?

For example, Carl Sagan says that the 4th dimensional tassarat can't be seen. But its there. A model he explains, shows a cube in a cube. Dimensions don't allow you to see the other objects: all you see is the imprint (as if a sliver of the object may be visible) thus only bottom & sides." Therefore, we may not see all dimensions of this object. Therefore, it could also appear as a halo or a upside down rainbow.

Sol in this state joins its twin or trinary, which may pull in objects such as Red & Brown Dwarfs as arms bob up and down in the Milky Way's spiral action. This state may include an attraction of even more material causing "defenses down or space fences up". If they are weakened or down Red

Dwarfs are invited in to rejoin in the trio event.”

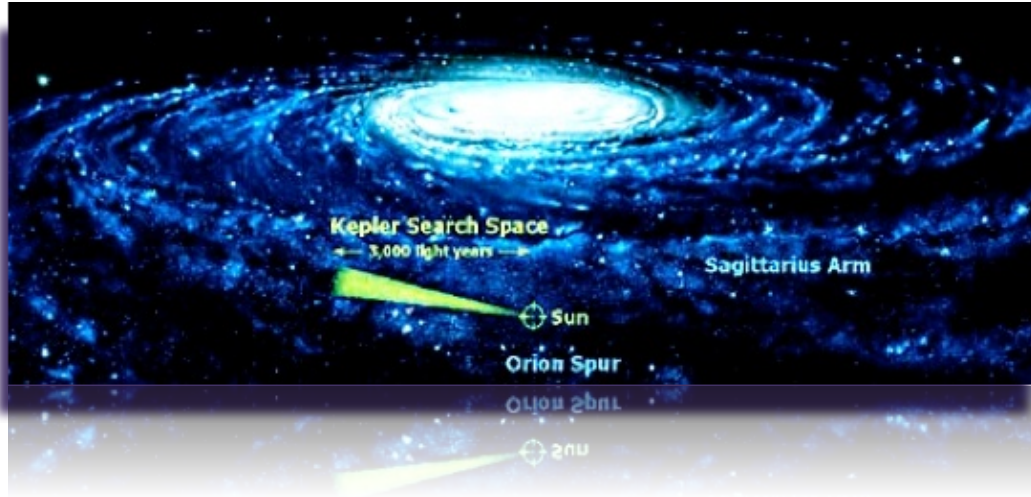

Theorists say the transformation changes if gravity unlocks, then the twins are free to roam no matter the distance. Since our Sun is moderate in size it may mean its binary is very large and once aligned with our sun it could produce a halo like effect. Have you noticed a multiple ringed rainbow or halo around the sun? If a red dwarf is nearby different interactions can be expected. A RED DWARF (although distant) could even be attached to the backside of the SUN with only its red glow visible from behind. Alignment if magnetically linked in the triad would be visible as its binary petals out red light orb reflections consistently while pulsing and flickering wildly. But more likely this "clan-destined" RED STAR binary is actually the trinary mate, being a true twin that can be in both places at one. At home in its relationship to another star seeing two parallel dimensions simultaneously.

Where do planets and moons come from?

Have you ever wondered, where do planets & moons come from? Is it possible that Red Dwarf Stars build new planets during this rare exchange of energy? Would they use spent cores of blown supernovas to re-spin a new planet or moon? And is a moon just a new stage in this development? After all we now have two moons. Does the Sun make failed planets into moons automatically? And how do regular planets become "gas planets" when they are the same size? There is much to learn about space and the creation of objects in space. And we have not heard the real story just yet.

Where is our Milky Way galaxy located?

In one article, some theorize the Sun's origin was from the Sagittarius Dwarf galaxy, or that the Milky Way is somehow entwined in the Sag galaxy, resulting in our galaxy eventually engulfing the smaller one. Of course, the Sagittarius arm is on our opposite side: Orion arm on one side, the Sag arm on the other facing the Galactic Core puts our position in perspective. Whatever the final outcome, the cycle of life appears to be renewed over and over as matter interacts with millions of celestial bodies.
