**Flow Cytometry—88182, 88184, 88185, 88187, 88188, 88189****Coverage Indications, Limitations, and/or Medical Necessity****HIV Infection**

The status of a Human Immunodeficiency Virus- (HIV) infected patient can be monitored by the analysis of the surface antigen CD4 (a T-cell receptor for HIV). This information can contribute to a prognosis as well as medical management for that individual (e.g., the need for AZT therapy or prophylaxis). Monitoring would be considered appropriate no greater in frequency than every 3 months. (When a patient is stable, especially during the long period of clinical latency, assays would be appropriate at a frequency less often. When the patient has an acute problem or therapy change, it may be necessary to perform the test at an increased frequency.)

**Leukemia or Lymphoma**

Leukemias and lymphomas may be analyzed in tissue, blood or marrow. Sometimes, flow cytometry may be performed on peripheral blood and fine needle aspirate material, thus, avoiding more invasive procedures for diagnosis. The presence or absence of antigens is determined using an antibody panel for appropriate diagnosis and classification. In the great majority of cases, 20 antibody determinations are sufficient to address diagnostic and prognostic concerns. This process is usually necessary at the initial diagnostic phase, for separate hematologic malignancies or when tumor is present in several anatomic sites. After this initial diagnostic phase, flow cytometry may be indicated to determine response to therapy.

**Organ Transplants**

Postoperative monitoring of organ transplants may be necessary to determine early rejection, immunosuppressive therapy toxicity or differentiation of infection from allograft rejection. The cells surface marker examined is CD3. This may require repeated analysis when symptoms are expressed for the above conditions by the transplant patient.

**Carcinomas**

DNA analysis of tumor for ploidy and percent-S-phase cells may be necessary for a few selective patients with carcinomas. Information obtained from flow cytometry is useful when the obtained prognostic information will affect treatment decisions in patients with low stage (localized disease). This is usually performed only one time after a diagnosis has been made and before treatment is initiated.

**Primary Immunodeficiencies**

Primary immunodeficiencies (e.g., Lymphocyte disorders, Phagocyte disorders, Monocyte/macrophage disorder) are immune disorders that are present at birth. These conditions are quite rare. Diagnosis typically occurs at an early age due to recurrent infections with frequent failures. Initial evaluation for suspected primary immunodeficiencies includes physical exam, laboratory evaluation (e.g., CBC, platelet, WBC with differential, ESR) and may include skin testing. Flow cytometry is indicated for diagnostic purposes in the presence of established disease or when abnormal results are found in the initial evaluation.

It is expected that the initial evaluation will contain a higher number of antibody examinations than a subsequent antibody examination.

**Human Chorionic Gonadotropin (hCG) — 84702****Limitations**

It is not reasonable and necessary to perform hCG testing more than once per month for diagnostic purposes. It may be performed as needed for monitoring of patient progress and treatment. Qualitative hCG assays are not appropriate for medically managing patients with known or suspected germ cell neoplasms.

## Human Immunodeficiency Virus (HIV) Testing (Diagnosis) — 86689, 86701, 86702, 86703, 87390, 87391, 87534, 87535, 87537, 87538

### Limitations

1. HIV antibody testing in the United States is usually performed using HIV-1 or HIV-2 combination tests. HIV-2 testing is indicated if clinical circumstances suggest HIV-2 is likely (that is compatible clinical findings and HIV-1 test negative). HIV-2 testing may be indicated in areas of the country where there is greater prevalence of HIV-2 infections.
2. The Western Blot test should be performed only after documentation that the initial EIA tests are repeatedly positive or equivocal on a single sample.
3. The HIV antigen tests currently have no defined diagnostic usage.
4. Direct viral RNA detection may be performed in those situations where serologic testing does not establish a diagnosis but strong clinical suspicion persists (for example, acute retroviral syndrome, nonspecific serologic evidence of HIV, or perinatal HIV infection).
5. If initial serologic tests confirm an HIV infection, repeat testing is not indicated.
6. If initial serologic tests are HIV EIA negative and there is no indication for confirmation of infection by viral RNA detection, the interval prior to retesting is 3-6 months.
7. Testing for evidence of HIV infection using serologic methods may be medically appropriate in situations where there is a risk of exposure to HIV. However, in the absence of a documented AIDS defining or HIV-associated disease, an HIV-associated sign or symptom, or documented exposure to a known HIV-infected source, the testing is considered by Medicare to be screening and thus is not covered by Medicare (for example, history of multiple blood component transfusions, exposure to blood or body fluids not resulting in consideration of therapy, history of transplant, history of illicit drug use, multiple sexual partners, same-sex encounters, prostitution, or contact with prostitutes).
8. The CPT Editorial Panel has issued a number of codes for infectious agent detection by direct antigen or nucleic acid probe techniques that have not yet been developed or are only being used on an investigational basis. Laboratory providers are advised to remain current on FDA-approval status for these tests.

## Screening for the Human Immunodeficiency Virus (HIV) Infection — G0432, G0433, G0435, G0475

### Nationally Covered Indications

Effective for claims with dates of service on and after April 13, 2015, CMS has determined that the evidence is adequate to conclude that screening for HIV infection for all individuals between the ages of 15 and 65 years, as recommended with a Grade of A by the USPSTF, is reasonable and necessary for early detection of HIV and is appropriate for individuals entitled to benefits under Part A or enrolled under Part B.

CMS shall cover screening for HIV with the appropriate U.S. Food and Drug Administration (FDA)-approved laboratory tests and point-of-care tests, used consistent with FDA-approved labeling and in compliance with the Clinical Laboratory Improvement Act (CLIA) regulations, when ordered by the beneficiary's physician or practitioner within the context of a healthcare setting and performed by an eligible Medicare provider for these services, for beneficiaries who meet one of the following conditions:

1. Except for pregnant Medicare beneficiaries addressed below, a maximum of one, annual, voluntary screening for all adolescents and adults between the age of 15 and 65, without regard to perceived risk.
2. Except for pregnant Medicare beneficiaries addressed below, a maximum of one, annual, voluntary screening for adolescents younger than 15 and adults older than 65 who are at increased risk for HIV infection. Increased risk for HIV infection is defined as follows:

Men who have sex with men,

Men and women having unprotected vaginal or anal intercourse,

- Past or present injection drug users,
- Men and women who exchange sex for money or drugs, or have sex partners who do,
- Individuals whose past or present sex partners were HIV-infected, bisexual, or injection drug users,
- Persons who have acquired or request testing for other sexually transmitted infectious diseases,
- Persons with a history of blood transfusions between 1978 and 1985,
- Persons who request an HIV test despite reporting no individual risk factors,
- Persons with new sexual partners,
- Persons who, based on individualized physician interview and examination, are deemed to be at increased risk for HIV infection. The determination of "increased risk" for HIV infection is identified by the health care practitioner who assesses the patient's history, which is part of any complete medical history, typically part of an annual wellness visit and considered in the development of a comprehensive prevention plan. The medical recommendation should be a reflection of the service provided.

3. A maximum of three, voluntary, HIV screenings of pregnant Medicare beneficiaries: (1) when the diagnosis of pregnancy is known, (2) during the third trimester, and, (3) at labor, if ordered by the woman's clinician.

### Nationally Non-Covered Indications

Effective for claims with dates of service on and after April 13, 2015:

- Medicare beneficiaries with any known diagnosis of an HIV-related illness are not eligible for this screening test.
- Medicare beneficiaries between the ages of 15 and 65 who have had a prior HIV screening test within 1 year are not eligible for HIV screening (i.e., at least 11 full months must have elapsed following the month in which the previous test was performed in order for the subsequent test to be covered).
- Medicare beneficiaries younger than 15 or older than 65, at increased risk for HIV-related illnesses, who have had a prior HIV screening test within 1 year are not eligible for HIV screening (i.e., at least 11 full months must have elapsed following the month in which the previous test was performed in order for the subsequent test to be covered).
- Pregnant Medicare beneficiaries who have had three specified screening tests within each respective term of pregnancy are not eligible for further HIV screening during their pregnancy.

## **in Vitro Chemosensitivity & Chemoresistance Assays— 81535, 81536, 84999, 89240**

### **Coverage Indications, Limitations, and/or Medical Necessity**

Novitas Solutions considers tumor chemosensitivity and chemoresistance assays (CSRAs) experimental and investigational as there has been insufficient evidence to support that these assays influence treatment options and improved clinical outcomes.

At the time of this LCD, there are only a few commercially available assays and only one assay (ChemoFx®) available in the Novitas jurisdictions.

#### **ChemoFx® is a drug response marker**

It is a two-way testing platform which includes both chemosensitivity and chemoresistance components for a broad range of agents and tumor types, following initial tumor cell culture and other steps. This assay is designed to help guide the physician's treatment decisions to assist in determining which chemotherapeutic agents are least likely to work and which are most likely to work for individual patients.

#### **Limitations:**

All steps of the chemosensitivity and chemoresistance assays are considered not reasonable and necessary for all neoplastic diseases, including either all solid tumors or blood borne dyscrasias (e.g. leukemia's, myelodysplastic disorders).

**Lipids — 80061, 82465, 83700, 83701, 83704, 83718, 83721, 84478****Limitations**

Lipid panel and hepatic panel testing may be used for patients with severe psoriasis which has not responded to conventional therapy and for which the retinoid etretinate has been prescribed and who have developed hyperlipidemia or hepatic toxicity. Specific examples include erythrodermia and generalized pustular type and psoriasis associated with arthritis. Routine screening and prophylactic testing for lipid disorder are not covered by Medicare. While lipid screening may be medically appropriate, Medicare by statute does not pay for it. Lipid testing in asymptomatic individuals is considered to be screening regardless of the presence of other risk factors such as family history, tobacco use, etc.

Once a diagnosis is established, one or several specific tests are usually adequate for monitoring the course of the disease. Less specific diagnoses (for example, other chest pain) alone do not support medical necessity of these tests.

When monitoring long-term anti-lipid dietary or pharmacologic therapy and when following patients with borderline high total or LDL cholesterol levels, it is reasonable to perform the lipid panel annually. A lipid panel at a yearly interval will usually be adequate while measurement of the serum total cholesterol or a measured LDL should suffice for interim visits if the patient does not have hypertriglyceridemia.

Any one component of the panel or a measured LDL may be medically necessary up to six times the first year for monitoring dietary or pharmacologic therapy. More frequent total cholesterol HDL cholesterol, LDL cholesterol and triglyceride testing may be indicated for marked elevations or for changes to anti-lipid therapy due to inadequate initial patient response to dietary or pharmacologic therapy. The LDL cholesterol or total cholesterol may be measured three times yearly after treatment goals have been achieved.

If no dietary or pharmacological therapy is advised, monitoring is not necessary.

When evaluating non-specific chronic abnormalities of the liver (for example, elevations of transaminase, alkaline phosphatase, abnormal imaging studies, etc.), a lipid panel would generally not be indicated more than twice per year.

## Loss-of-Heterozygosity Based Topographic Genotyping with PathfinderTG® — 81479

### Coverage Indications, Limitations, and/or Medical Necessity

PathfinderTG® will be considered medically reasonable and necessary when selectively used as an **occasional second-line diagnostic supplement**:

- only where there remains clinical uncertainty as to either the current malignancy or the possible malignant potential of the pancreatic cyst based upon a comprehensive first-line evaluation; **AND**
- a decision regarding treatment (e.g. surgery) has NOT already been made based on existing information.

### Criteria for Coverage

The specific requirements for medical necessity involve:

1. Highly-concise affirmation, documented in the medical record, that a decision regarding treatment has not already been made and that the results of the molecular evaluation will assist in determining if more aggressive treatment than what is being considered is necessary.

2. Previous first-line diagnostics, such as, but not restricted to, the following have demonstrated:

a. A pancreatic cyst fluid carcinoembryonic antigen (CEA), which is greater than or equal to 200 ng/ml, suggesting a mucinous cyst, but is not diagnostic.

b. Both cyst cytopathologic and/or radiographic findings, which raise the index of malignancy suspicion, but where second-line molecular diagnostics is expected to be more compelling in the context of a surgical vs. non-surgical care plan.

### LIMITATIONS:

All PathfinderTG® indications other than pancreatic cyst fluid evaluation are considered investigational and are therefore not considered medically reasonable and necessary due to insufficient data on both analytical and clinical validity.

## Molecular Diagnostics: Genitourinary Infectious Disease Testing —87480, 87481, 87490, 87491, 87510, 87590, 87591, 87660, 87798

### Coverage Indications, Limitations, and/or Medical Necessity

Molecular diagnostic testing, which includes DNA- or RNA-based analysis, with or without amplification/quantification, provides sensitive, specific and timely (i.e., relative to that of traditional culture-based methods) identification of diverse biological entities, including microorganisms and tumors. The current LCD will focus upon coverage of the more prevalent (typical) bacterial and fungal organisms (per the eight organism-specific CPT codes, ranging from 87480 to 87660) which are encountered for the majority of gynecological infectious presentations. Conversely, there are less typically encountered (rare) pathogens for which genitourinary (GU) microbiological evaluations (i.e., sometimes including panel testing) are less well-established and even investigational. In this context, medical review, educational outreach, etc. will be conducted on an as-needed basis.

### Utilization Guidelines

No more than two individual microorganisms may be concurrently billed for CPT 87481 and 87798.

**Medicare is establishing the following limited coverage for *Chlamydia trachomatis* (87490, 87491), *Neisseria gonorrhoeae* (87590, 87591), *Candida species* (87480), *Gardnerella vaginalis* (87510) and *Trichomonas vaginalis* (87660):**

**Indications and Limitations of Coverage**

A diagnostic pap smear and related medically necessary services are covered under Medicare Part B when ordered by a physician under one of the following conditions:

- Previous cancer of the cervix, uterus, or vagina that has been or is presently being treated;
- Previous abnormal pap smear;
- Any abnormal findings of the vagina, cervix, uterus, ovaries, or adnexa;
- Any significant complaint by the patient referable to the female reproductive system; or
- Any signs or symptoms that might in the physician's judgment reasonably be related to a gynecologic disorder.

**Screening for Pap Smears — G0123, G0124, G0141, G0143, G0144, G0145, G0147, G0148, P3000, P3001****Indications and Limitations of Coverage****Screening Pap Smear**

A screening pap smear and related medically necessary services provided to a woman for the early detection of cervical cancer (including collection of the sample of cells and a physician's interpretation of the test results) and pelvic examination (including clinical breast examination) are covered under Medicare Part B when ordered by a physician (or authorized practitioner) under one of the following conditions:

- She has not had such a test during the preceding two years or is a woman of childbearing age (§1861(nn) of the Social Security Act (the Act)).
- There is evidence (on the basis of her medical history or other findings) that she is at high risk of developing cervical cancer and her physician (or authorized practitioner) recommends that she have the test performed more frequently than every two years.

High risk factors for cervical and vaginal cancer are:

- Early onset of sexual activity (under 16 years of age)
- Multiple sexual partners (five or more in a lifetime)
- History of sexually transmitted disease (including HIV infection)
- Fewer than three negative or any pap smears within the previous seven years; and
- DES (diethylstilbestrol) - exposed daughters of women who took DES during pregnancy.

**NOTE:** Claims for pap smears must indicate the beneficiary's low or high risk status by including the appropriate diagnosis code on the line item (Item 24E of the Form CMS-1500).

**Definitions**

- A woman as described in §1861(nn) of the Act is a woman who is of childbearing age and has had a pap smear test during any of the preceding 3 years that indicated the presence of cervical or vaginal cancer or other abnormality, or is at high risk of developing cervical or vaginal cancer.
- A woman of childbearing age is one who is premenopausal and has been determined by a physician or other qualified practitioner to be of childbearing age, based upon the medical history or other findings.
- Other qualified practitioner, as defined in 42 CFR 410.56(a) includes a certified nurse midwife (as defined in §1861(gg) of the Act), or a physician assistant, nurse practitioner, or clinical nurse specialist (as defined in §1861(aa) of the Act) who is authorized under State law to perform the examination.

## **Pharmacokinetic (PK) Testing for Chemotherapy Dosing— 84999**

### **Coverage Indications, Limitations, and/or Medical Necessity**

The customization of chemotherapy dosing via quantitative chemical (i.e., pharmacokinetic) methods is an emerging alternative to less rigorous methods such as body surface area (BSA dosing), but in spite of selected supporting literature for some testing, such as the My5-FU™ 5-fluorouracil exposure optimization test (Saladax Biomedical Laboratories, Bethlehem, PA), there has been a lack of apparent oncologist demand for such dosing methods, in tandem with the current lack of national guidelines (e.g., via NCCN).

As a result, pharmacokinetic dosing methodology is considered investigational and non-covered at the present time.

## Prostate Cancer Screening Tests — G0103

Screening prostate specific antigen tests are covered at a frequency of once every 12 months for men who have attained age 50 (at least 11 months have passed following the month in which the last Medicare-covered screening prostate specific antigen test was performed). Screening prostate specific antigen tests (PSA) means a test to detect the marker for adenocarcinoma of prostate. PSA is a reliable immunocytochemical marker for primary and metastatic adenocarcinoma of prostate. This screening must be ordered by the beneficiary's physician or by the beneficiary's physician assistant, nurse practitioner, clinical nurse specialist, or certified nurse midwife (the term "attending physician" is defined in §1861(r)(1) of the Act to mean a doctor of medicine or osteopathy and the terms "physician assistant, nurse practitioner, clinical nurse specialist, or certified nurse midwife" are defined in §1861(aa) and §1861(gg) of the Act) who is fully knowledgeable about the beneficiary's medical condition, and who would be responsible for using the results of any examination (test) performed in the overall management of the beneficiary's specific medical problem.

**Prostate Specific Antigen — 84153****Limitations**

Generally, for patients with lower urinary tract signs or symptoms, the test is performed only once per year unless there is a change in the patient's medical condition.  
Testing with a diagnosis of in situ carcinoma is not reasonably done more frequently than once, unless the result is abnormal, in which case the test may be repeated once.

**Prothrombin Time — 85610****Limitations**

1. When an ESRD patient is tested for PT, testing more frequently than weekly requires documentation of medical necessity, e.g., other than chronic renal failure or renal failure unspecified.
2. The need to repeat this test is determined by changes in the underlying medical condition and/or the dosing of warfarin. In a patient on stable warfarin therapy, it is ordinarily not necessary to repeat testing more than every two to three weeks. When testing is performed to evaluate a patient with signs or symptoms of abnormal bleeding or thrombosis and the initial test result is normal, it is ordinarily not necessary to repeat testing unless there is a change in the patient's medical status.
3. Since the INR is a calculation, it will not be paid in addition to the PT when expressed in seconds, and is considered part of the conventional PT test.
4. Testing prior to any medical intervention associated with a risk of bleeding and thrombosis (other than thrombolytic therapy) will generally be considered medically necessary only where there are signs or symptoms of a bleeding or thrombotic abnormality or a personal history of bleeding, thrombosis or a condition associated with a coagulopathy. Hospital/clinic-specific policies, protocols, etc., in and of themselves, cannot alone justify coverage.

## Screening for Hepatitis C Virus (HCV) in Adults — G0472

A screening test is covered for adults at high risk for HCV infection. "High risk" is defined as persons with a current or past history of illicit injection drug use; and persons who have a history of receiving a blood transfusion prior to 1992. Repeat screening for high risk persons is covered annually only for persons who have had continued illicit injection drug use since the prior negative screening test.

A single screening test is covered for adults who do not meet the high risk definition as defined above, but who were born from 1945 through 1965. For services provided to beneficiaries born between the years 1945 and 1965 who are not considered high risk as defined in the policy, HCV screening is limited to once per lifetime.

A screening test is covered for adults at high risk for HCV infection. "High risk" is defined as persons with a current or past history of illicit injection drug use; and persons who have a history of receiving a blood transfusion prior to 1992. Repeat screening for high risk persons is covered annually only for persons who have had continued illicit injection drug use since the prior negative screening test.

Those born prior to 1945 or after 1965 with no risk factors are not eligible for this benefit.

## Screening for Sexually Transmitted Infections (STIs) — 86592, 86593, 86631, 86632, 86780, 87110, 87270, 87320, 87340, 87341, 87490, 87491, 87590, 87591, 87800, 87810, 87850

CMS has determined that the evidence is adequate to conclude that screening for chlamydia, gonorrhea, syphilis, and hepatitis B, as well as HIBC to prevent STIs, consistent with the grade A and B recommendations by the USPSTF, is reasonable and necessary for the early detection or prevention of an illness or disability and is appropriate for individuals entitled to benefits under Part A or enrolled under Part B.

Therefore, effective for claims with dates of services on or after November 8, 2011, CMS will cover screening for these USPSTF-indicated STIs with the appropriate Food and Drug Administration (FDA)-approved/cleared laboratory tests, used consistent with FDA-approved labeling, and in compliance with the Clinical Laboratory Improvement Act (CLIA) regulations, when ordered by the primary care physician or practitioner, and performed by an eligible Medicare provider for these services.

### Screening for Chlamydia, Gonorrhea or Syphilis:

The following ICD-10-CM codes support the medical necessity of Chlamydia (CPT codes 86631, 86632, 87110, 87270, 87320, 87490, 87491, 87810, and 87800); Gonorrhea (CPT codes 87590, 87591, 87850, and 87800); or Syphilis (CPT codes 86592, 86593, and 86780) in **women at increased risk who are not pregnant** when the screening is billed with the following:

Z11.3 Encounter for screening for infections with a predominantly sexual mode of transmission  
AND

Z72.89 Other problems related to lifestyle OR Z72.51-Z72.53 High risk sexual behavior

Note: 11 full months must elapse following the month in which the previous test was performed in order for the subsequent test to be covered.

### Screening for Syphilis:

The following ICD-10-CM codes support the medical necessity of Syphilis (CPT codes 86592, 86593, and 86780)

- For one (1) annual screening in **men at increased risk** when the screening is billed with the following:

Z11.3 Encounter for screening for infections with a predominantly sexual mode of transmission  
AND

Z72.89 Other problems related to lifestyle OR Z72.51-Z72.53 High risk sexual behavior

Note: 11 full months must elapse following the month in which the previous test was performed in order for the subsequent test to be covered.

- For one (1) screening test per pregnancy in **pregnant women not at increased risk** when screening is billed with the following:

Z11.3 Encounter for screening for infections with a predominantly sexual mode of transmission  
AND

accompanied by one of the specified supervision of pregnancy ICD-10 diagnosis codes

- For up to three (3) screening tests per pregnancy in **pregnant women who are at increased risk** for STIs when screening is billed with the following:

Z11.3 Encounter for screening for infections with a predominantly sexual mode of transmission  
AND

Z72.89 Other problems related to lifestyle OR Z72.51-Z72.53 High risk sexual behavior  
AND

accompanied by one of the specified supervision of pregnancy ICD-10 diagnosis codes

NOTE: The 2nd and 3rd tests must be billed with ICD-10 code Z11.3 and Z72.89 OR

Z72.51-Z72.53 AND one of the supervision of pregnancy diagnosis codes. The initial test may be billed with or without Z72.89, Z72.51-Z72.53

### Screening for Chlamydia:

The following ICD-10-CM codes support the medical necessity of Chlamydia (CPT codes 86631, 86632, 87110, 87270, 87320, 87490, 87491, 87810, and 87800) for up to two (2) screening tests per pregnancy in **pregnant women who are at increased risk** for STIs when screening is billed with the following:

Z11.3 Encounter for screening for infections with a predominantly sexual mode of transmission  
AND

Z72.89 Other problems related to lifestyle OR Z72.51-Z72.53 High risk sexual behavior  
AND

accompanied by one of the specified supervision of pregnancy ICD-10 diagnosis codes

### Screening for Gonorrhea:

The following ICD-10-CM codes support the medical necessity of Gonorrhea (CPT codes 87590, 87591, 87850, and 87800) for up to two (2) screening tests per pregnancy in pregnant women who are at increased risk for STIs when screening is billed with the following:

Z11.3 Encounter for screening for infections with a predominantly sexual mode of transmission

AND

Z72.89 Other problems related to lifestyle OR Z72.51-Z72.53 High risk sexual behavior

AND

accompanied by one of the specified supervision of pregnancy ICD-10 diagnosis codes

### Screening for Hepatitis B:

The following ICD-10-CM codes support the medical necessity of Hepatitis B (Hepatitis B Surface Antigen (CPT codes 87340, and 87341) for one (1) screening test per pregnancy in **pregnant women not at an increased risk** when screening is billed with the following:

Z11.59 Encounter for screening for other viral diseases

AND

accompanied by one of the specified supervision of pregnancy ICD-10 diagnosis codes

### Screening for Hepatitis B:

The following ICD-10-CM codes support the medical necessity of Hepatitis B (Hepatitis B Surface Antigen (CPT codes 87340, and 87341) for up to two (2) screening tests per pregnancy in **pregnant women who are at increased risk** for STIs when screening is billed with the following:

Z11.59 Encounter for screening for other viral diseases

AND

Z72.89 Other problems related to lifestyle OR Z72.51-Z72.53 High risk sexual behavior

AND

accompanied by one of the specified supervision of pregnancy ICD-10 diagnosis codes

NOTE: The 2nd and 3rd tests must be billed with ICD-10 code Z11.3 and Z72.89 OR

Z72.51-Z72.53 AND one of the supervision of pregnancy diagnosis codes. The initial test may be billed with or without Z72.89, Z72.51-Z72.53
