Reading in a Structure File

File path to structure file: use the browse box to input the file path to a structure file for your crystal. Then press "read structure file". The message "Structure file read successfully" will be displayed in the notification window if the file was read successfully.

The structure file contains all the information *CrystalGrower* requires to assemble the crystal structure to be simulated. This is one of the files generated via *ToposPro*. The structure file is discussed in detail in the Data Input Files section of the manual. A message is displayed to inform the user that the structure file has been read successfully.
