MICROBLADE STYLIST

Aftercare Instructions

Prior to any manipulation to the treatment area wash hands thoroughly. This will avoid introducing bacteria to the treatment area and greatly reduces the chance for infection.

The first 2 days: Using a patting motion, gently clean the application area every hour using distillate water and a cotton pad. After cleaning the area apply a thin layer of Aquaphor. Avoid excessive Aquaphor.

The following days after: After the first two days discontinue the use of distilled water and hourly care. Apply Aquaphor 4 to 5 times a day. Any formed scab to the treatment area will begin to fall off. Allow the removal of scab to occur naturally. Any purposeful or forced removal of scab from the treatment area will alter the final results.

WARNING: Picking, forced removal, or scratching the formed scab on the treatment area will remove pigment, alter final results, can cause scarring, and increases the risk for infection.

DO NOT PICK. DO NOT SCRATCH.

What to avoid for 1 week:

- Washing the treatment area
- Swimming/Jacuzzis
- Saunas
- Tanning
- Excessive sweating
- Serums on the treatment area
- Make-up application to treatment area.
- Wiping or cleaning with Terry towels (household towels)
- Hot/steamy showers (baths are recommended)
- Water, shampoo, and conditioner to treatment area.

What you should do during the healing process:

- Avoid pigment area when cleansing face.
- Keep treatment area moistened with a light application of Aquaphor.
- Avoid the treatment area from becoming too dry (use Aquaphor).
- If the treatment area is exposed to water, gently pat dry with clean tissue.
- Use a clean tissue, cotton swab, and application stick per eyebrow.

Why Aquaphor?

Aquaphor is a great product for the healing process because it creates a barrier between the skin and bacteria. It is also effective in preventing the pigmented area from becoming dry. A moist barrier is ideal for fast and undisturbed healing.
