The Effect of Intention and Thoughts on the World around Us...

Your thoughts and emotions connect you to others. Thoughts are not material things as such but they do have bioelectrical and biochemical frequencies which have been shown to have actual effects on the material world. Let's examine some of the evidence for this.

In 1974, German physicist Fritz-Albert Popp proved that all biological systems transmit light and information. Light means photons, which are the subatomic particles of light, so Popp called these; biophotons. They are subatomic light particles emanating from every living system, including from the cells and DNA of our bodies.

A study by Slovenian researchers - who wanted to know whether it was possible to show and quantifiably measure the biophotons radiating from a person's body when he or she was sending loving intentions to someone else, and if that emission rate would differ from the emission rate when that person was not sending loving intentions.

In their experiment, they paired people, one of which was going to send loving intentions to the other person.

The researchers measured the biophoton emissions from the heart of the person who was sending loving intentions to the other person—the receiver—who was in another room and sitting quietly, not doing anything in particular. This receiver was hooked up to equipment to monitor his or her heart rate via their pulse. The experiment was set up so that the sender could signal when he or she was beginning to send 'loving energy' to the receiver.

The experiment yielded some spectacular data:

- Baseline pre-meditation biophoton emissions from the heart of the 'sending person' were measured at **20 photons per second.**
- When this person entered the heart-centered state, the persons biophoton emissions shot up to **37,000 – 45,000 photons per second.**
- When the person was fully and deeply engaged in the loving state, his heart biophoton emission rate increased dramatically again, to **1,000,000 photons per second!**
- The 'love energy and information' was registered by the receiver's heart within one to two seconds of it being sent and the **receiver's pulse rate went up by ten to fifteen beats per minute!**

If your pulse suddenly went up 10-15 beats you would know about it!

The field of energy that carries our thoughts and emotions can actually be seen. The **image below** shows visually the results of the experiment using a biophoton capture device called EPC (Electro Photon Capture).

(When one person in a coherent heart state sends loving thoughts and energy to another person, the exchange of energy can actually be imaged. Right side 'b' sending to left side and left side 'a' receiving the loving energy measured as biophoton emissions. This image is reproduced with the kind permission of Dr Konstantin Korotkov (www.korotkov.org) and. P. Krishna Madappa (www.ISSSTAOS.org)

In this experiment, what was captured was the image of a person (on the right in the image, labelled 'b') in the process of intentionally sending loving thoughts to the other person (on the left, labelled 'a'). **A flare of energy can be seen leaving the 'sender's' body** from the heart area and being accepted by the heart of the receiver.

What is even more impressive is that the sender and receiver were in two separate buildings when the experiment was conducted and the images taken!

This study confirms quite clearly that when our thoughts, feelings and intentions are coherent, we create a powerful resonance energy that can affect us personally and can also influence others.

This is a fine example of how the new scientific paradigm shows us the power we have to heal ourselves and the environment with our thoughts feelings and intentions.

What 'vibes' are you sending out to your friends and colleagues today?
