Abstract

A consolidated literature-based checklist of two hundred and eight species of poroid fungi from Kerala, belonging to 89 genera, placed in the orders *Hymenochaetales* and *Polyporales* (class *Agaricomycetes*), is provided. From Kerala, 155 species of *Polyporales* distributed in fourteen families, and 53 species belonging to five families of the *Hymenochaetales* have been recorded. This checklist is an updated biodiversity inventory of polypores of Kerala part of the Western Ghats.

Keywords: Agaricomycetes; Basidiomycota; Kerala; polypores; systematics.

1. Introduction

Kerala has a rich mycobiota as evident from several published accounts (Florence, 2004; Mohanan, 2011; Farook *et al.*, 2013; Kumar *et al.*, 2019; Kumar & Vinjusha, 2023). These compilations list more than 700 basidiomycotan taxa documented from Kerala. Of these, fungi with smooth to poroid hymenium classified under two orders (*Hymenochaetales*, *Polyporales*) of Agaricomycetes, are a major group of ecological and economic significance. Adarsh *et al.* (2018) had published a checklist of polypores reported from Kerala with 148 species in 68 genera under 8 families. However, later revisionary studies (Vinjusha & Kumar, 2022, 2024) prove that many taxa earlier known from Kerala were synonyms or misidentifications and that their taxonomy has to be updated according to the latest classification systems. Subsequent species reports and discoveries from the region also remain to be included. Hence, a revised checklist that reflect the current taxonomy and diversity of poroid fungi of Kerala has been prepared.

2. Materials and methods

Here we provide a literature-based checklist of the poroid fungi reported from Kerala so far. The species name and its systematic position are given as per the current classification provided in the *Index Fungorum* (www.speciesfungorum.org). Replaced names are provided in brackets in the reference part of the table. We use semicolons for separating different reports on the species names and commas for separating the works which report the species names as the replaced synonyms, provided in brackets. New species which are invalidly published in the referred works are not included in the present checklist. Taxa which are only identified to genus level are also excluded from the checklist. Genera and species are listed in alphabetical order. The expanded terms of the abbreviations used in the checklist have been provided at the end of the table. Figure 1 represents the study area Kerala state, India with names of districts in abbreviations.

3. Results and discussion

Two hundred and eight species of poroid fungi belonging to 89 genera, placed in two orders (*Hymenochaetales* and *Polyporales*) of the class Agaricomycetes are listed. As per the available reports, in Kerala, the order *Polyporales* (155 species) is represented by fourteen families, and the order *Hymenochaetales* (53 species) by five families. The genus *Trametes* (*Polyporaceae*) includes the highest number of species (18). Since the publication of the last checklist of poroid fungi from Kerala (Adarsh *et al.*, 2018), 60 new poroid species have been reported from Kerala. This checklist highlights the extent of diversity of poroid fungi in the Kerala part of the Western Ghats.

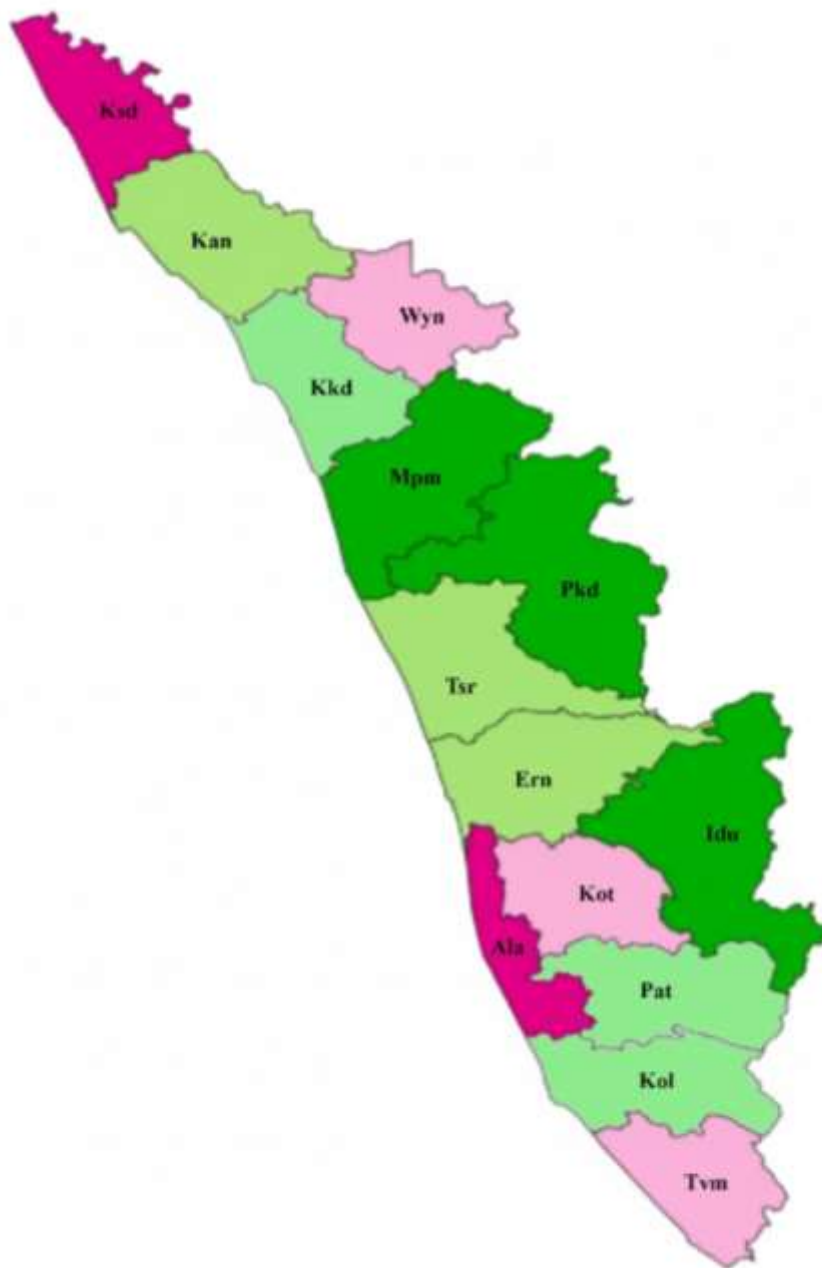

Figure 1.Outline map of Kerala showing the districts (expanded district names are provided at the end of the checklist).
