WHAT ABOUT THE DOG?

The most frequently asked question...
"Is the turf pet friendly?"

YES!

Your turf system is perforated every 3 square inches and drains instantaneously at a rate of 40 inches an hour.

UV rays will eliminate 99% of all bacteria on the turf surface. In more shaded areas, deodorized infills are available to help prevent pet odors.

TIP: You can hose down the surface to help flush out the turf system!

WHAT LIES BENEATH?

First, we excavate the top layer of your existing landscape - typically a 4 inch profile to create a level working surface.

A geotextile fabric will be installed above subgrade to help prevent new growth.

Next, a permeable stone is installed at a depth of 4 inches, and is compacted to create a base with sufficient drainage for the turf system. For putting green applications, a layer of fine stone is added to create shape and undulation, elevating your putting experience.

Finally is the installation of the synthetic turf that best meets the needs of your project. An infill, typically fine silica sand, is then brushed in. This has a dual purpose of weight distribution, as well as lifting the individual fibers for a more plush and natural aesthetic.

Our expertise and precision, paired with these installation procedures, ensure that your turf landscape will be of the highest quality and performance.
