

NOVEL FLYING EM SENSOR FOR AGRICULTURAL RESEARCH

Larisa Golovko (Landviser, USA & Czech Rep) and Yuri Manstein (SiberGeo, Estonia & Russia)

This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement No 824478.

On the Farm – it All starts with Soil...

- Despite the advantage of the satellite and UAV imagery platforms and wide-spread utilization of GIS analytics, the detail information about topsoil and near-surface layers is still difficult to obtain without soil sampling and laboratory analysis, which is expensive and time-consuming.
- Electrical resistivity (RES) and conductivity (EC) are fundamental parameters directly related with soil salinity, NPK fertilizer uptake, pH, texture, organic matter, water content and other properties affected by the density of mobile electrical charges in soil layers.
- Unlike agronomic soil properties, electrical parameters can be easily, repeatedly, and reliably measured *in-situ* and in lab with various geophysical instruments; therefore, are **universal soil characteristics** useful for mapping and monitoring farmlands.
- Portable geophysical instruments of direct current – for RES/EC/IP/SP (LandMapper by Landviser, USA; SibER by SiberGeo, Estonia) and electromagnetic induction – for RES/EC (Geovizer and AEMP-14 by KB Electrometry, Russia).

UAV Imagery Benefits

- UAV vs Satellite
 - High Resolution
 - Unaffected by Cloud cover
- Tree-level Accuracy
- Multispectral/Hyperspectral
- ID diseases
 - Citrus Canker
 - Citrus Greening

Yield Predictions from Drone Imagery during Plant Growth

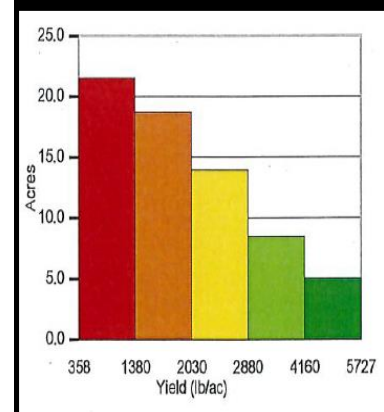

Crop Season: 2019
Harvest Date(s): 8/3/2019

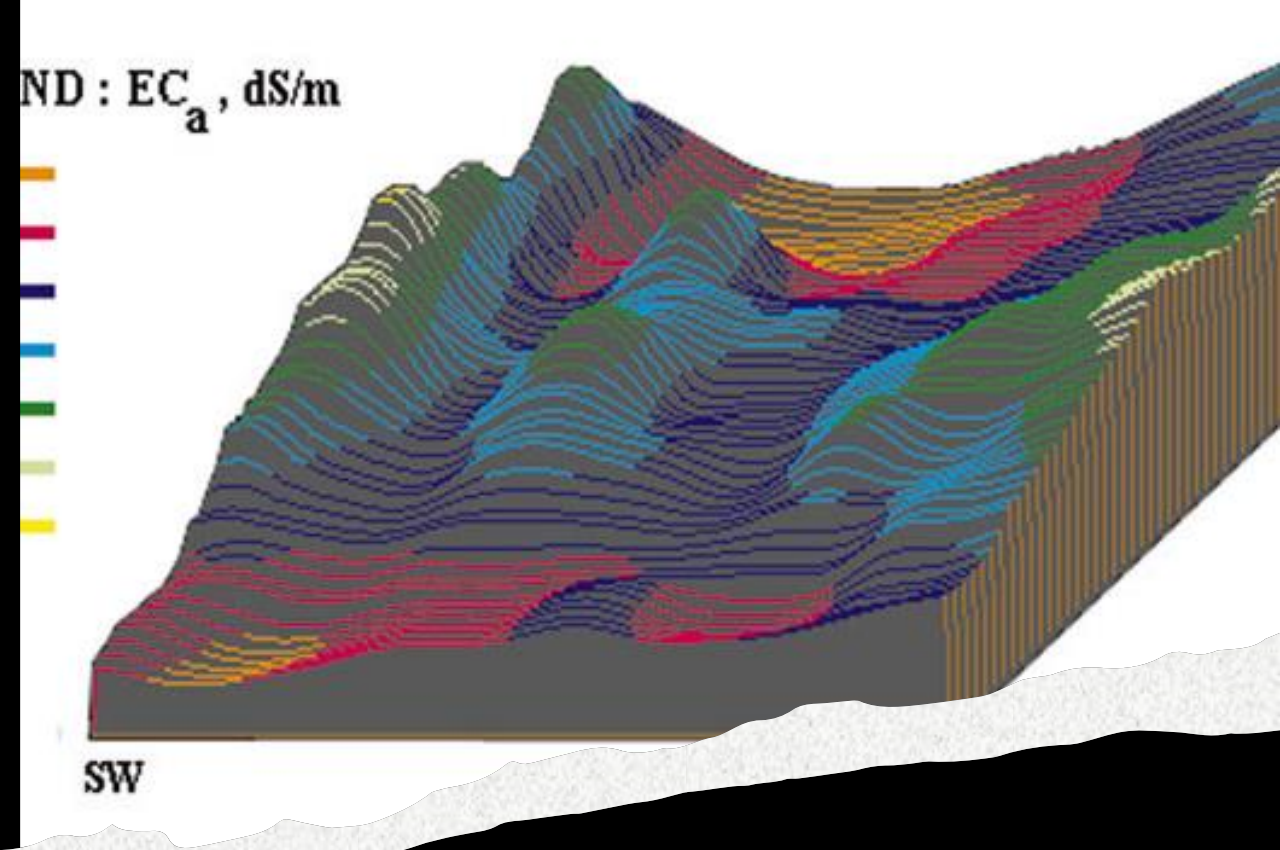

Harvested Area: 67.56 ac
Min: 358.08 lb/ac
Max: 5,727.27 lb/ac
Avg: 2,090.45 lb/ac
Total Product: 141,239.99 lb

Salinity:
persistent, not
visible, EC-related

- No salts are visible, but rice seedlings die

LandMapper[®] is... Portable and Scalable!

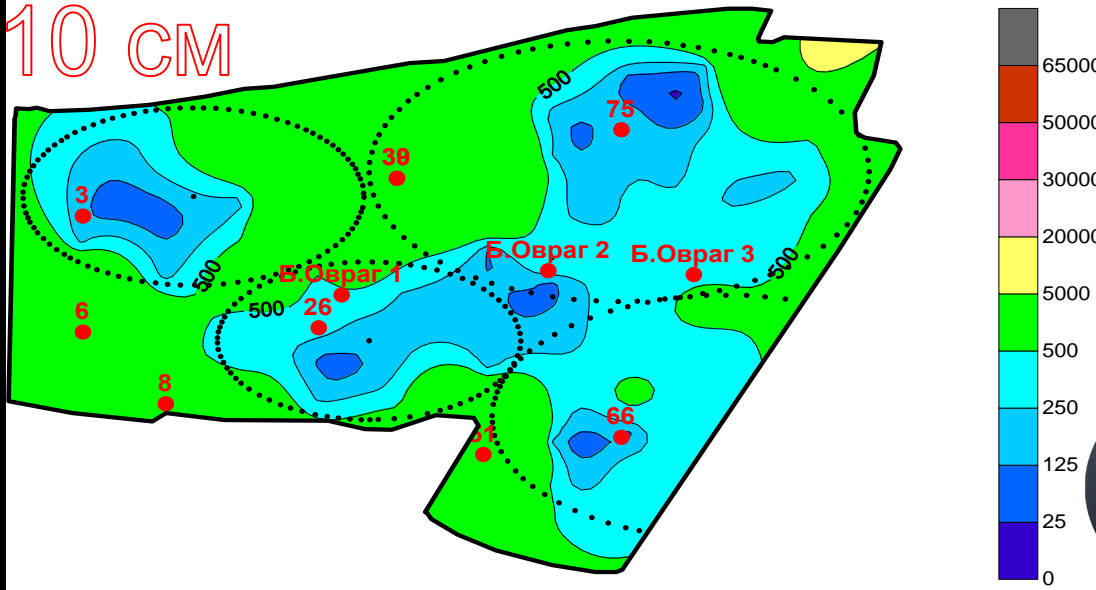

- Fits in a shirt pocket
- Runs all season from standard 9V battery
- Measures EC/ER in irrigation water, saturated soil paste as well as in the field soils from 2 cm to ~30 m depth (manual 1D VES)

Multi-frequency Electromagnetic (EM) Profiling

AEMP-14

GEOVIZER

Electromagnetic profiling on any set of 3 (Geovizer) or 14 (AEMP-14) fixed frequencies in range 2.5 - 250 kHz, with automatic GPS referencing and previewing of 2D/3D models!

With EM Profiling YOU can:

- monitor the status of underground utilities
- determine the location of pipelines, cables, tunnels
- map groundwater and its pollution
- research archaeological sites
- assess agricultural land
- monitor contamination by fuels and lubricants
- conduct engineering surveys for construction

Profiling and Visualization of 2D/3D data, as well as preparing reports is easy with **Android** (Qzond) and **Win** (iiSystem) **software** (included)

Geophysical Instruments

	LandMapper	Geoviser	AEMP-14
Properties	EC/ER/SP	EC/ER	EC/ER
Mobile Mapping	Yes, grounding	Yes, <20 km/h	Yes, <20 km/h
1D profiles	Yes*	No	Yes
2D / 3D	Yes*	No	Yes
Resolution	2 cm – 1 m	3 depths / freq. 12, 40, 104 kHz	14 depths / freq. in 2.5-250 kHz
Max Depth	~30 m	~3 m	~8-10 m

**LandMapper handheld only supports manual movement of each 4-electrode combination for 1D VES profiles and 2D imaging, wire sets are supplied or easily made by user*

Steps to develop Ag EMGeoDrone

Test AEMP-14 on Ag fields – which frequencies best describe soil agronomic properties?

Lighten Geovizer sensor and put it on OTS DJI UAV

Develop New Ag sensor with “Ag” target frequencies and partner with drone manufacturers

Electromagnetic multi-frequency profilers

AEMP-14

TECHNICAL SPECIFICATION

Working frequencies: 2.5-250 kHz;

Measurement time: 0.3-2 sec;

Generator power: maximum 90 W;

Receiver sensitivity: 1 mV;

Dimensions: 275x30x10 cm;

Working time: about 6 hours;

Weight: 9 kg;

Software compatibility: Android, Windows.

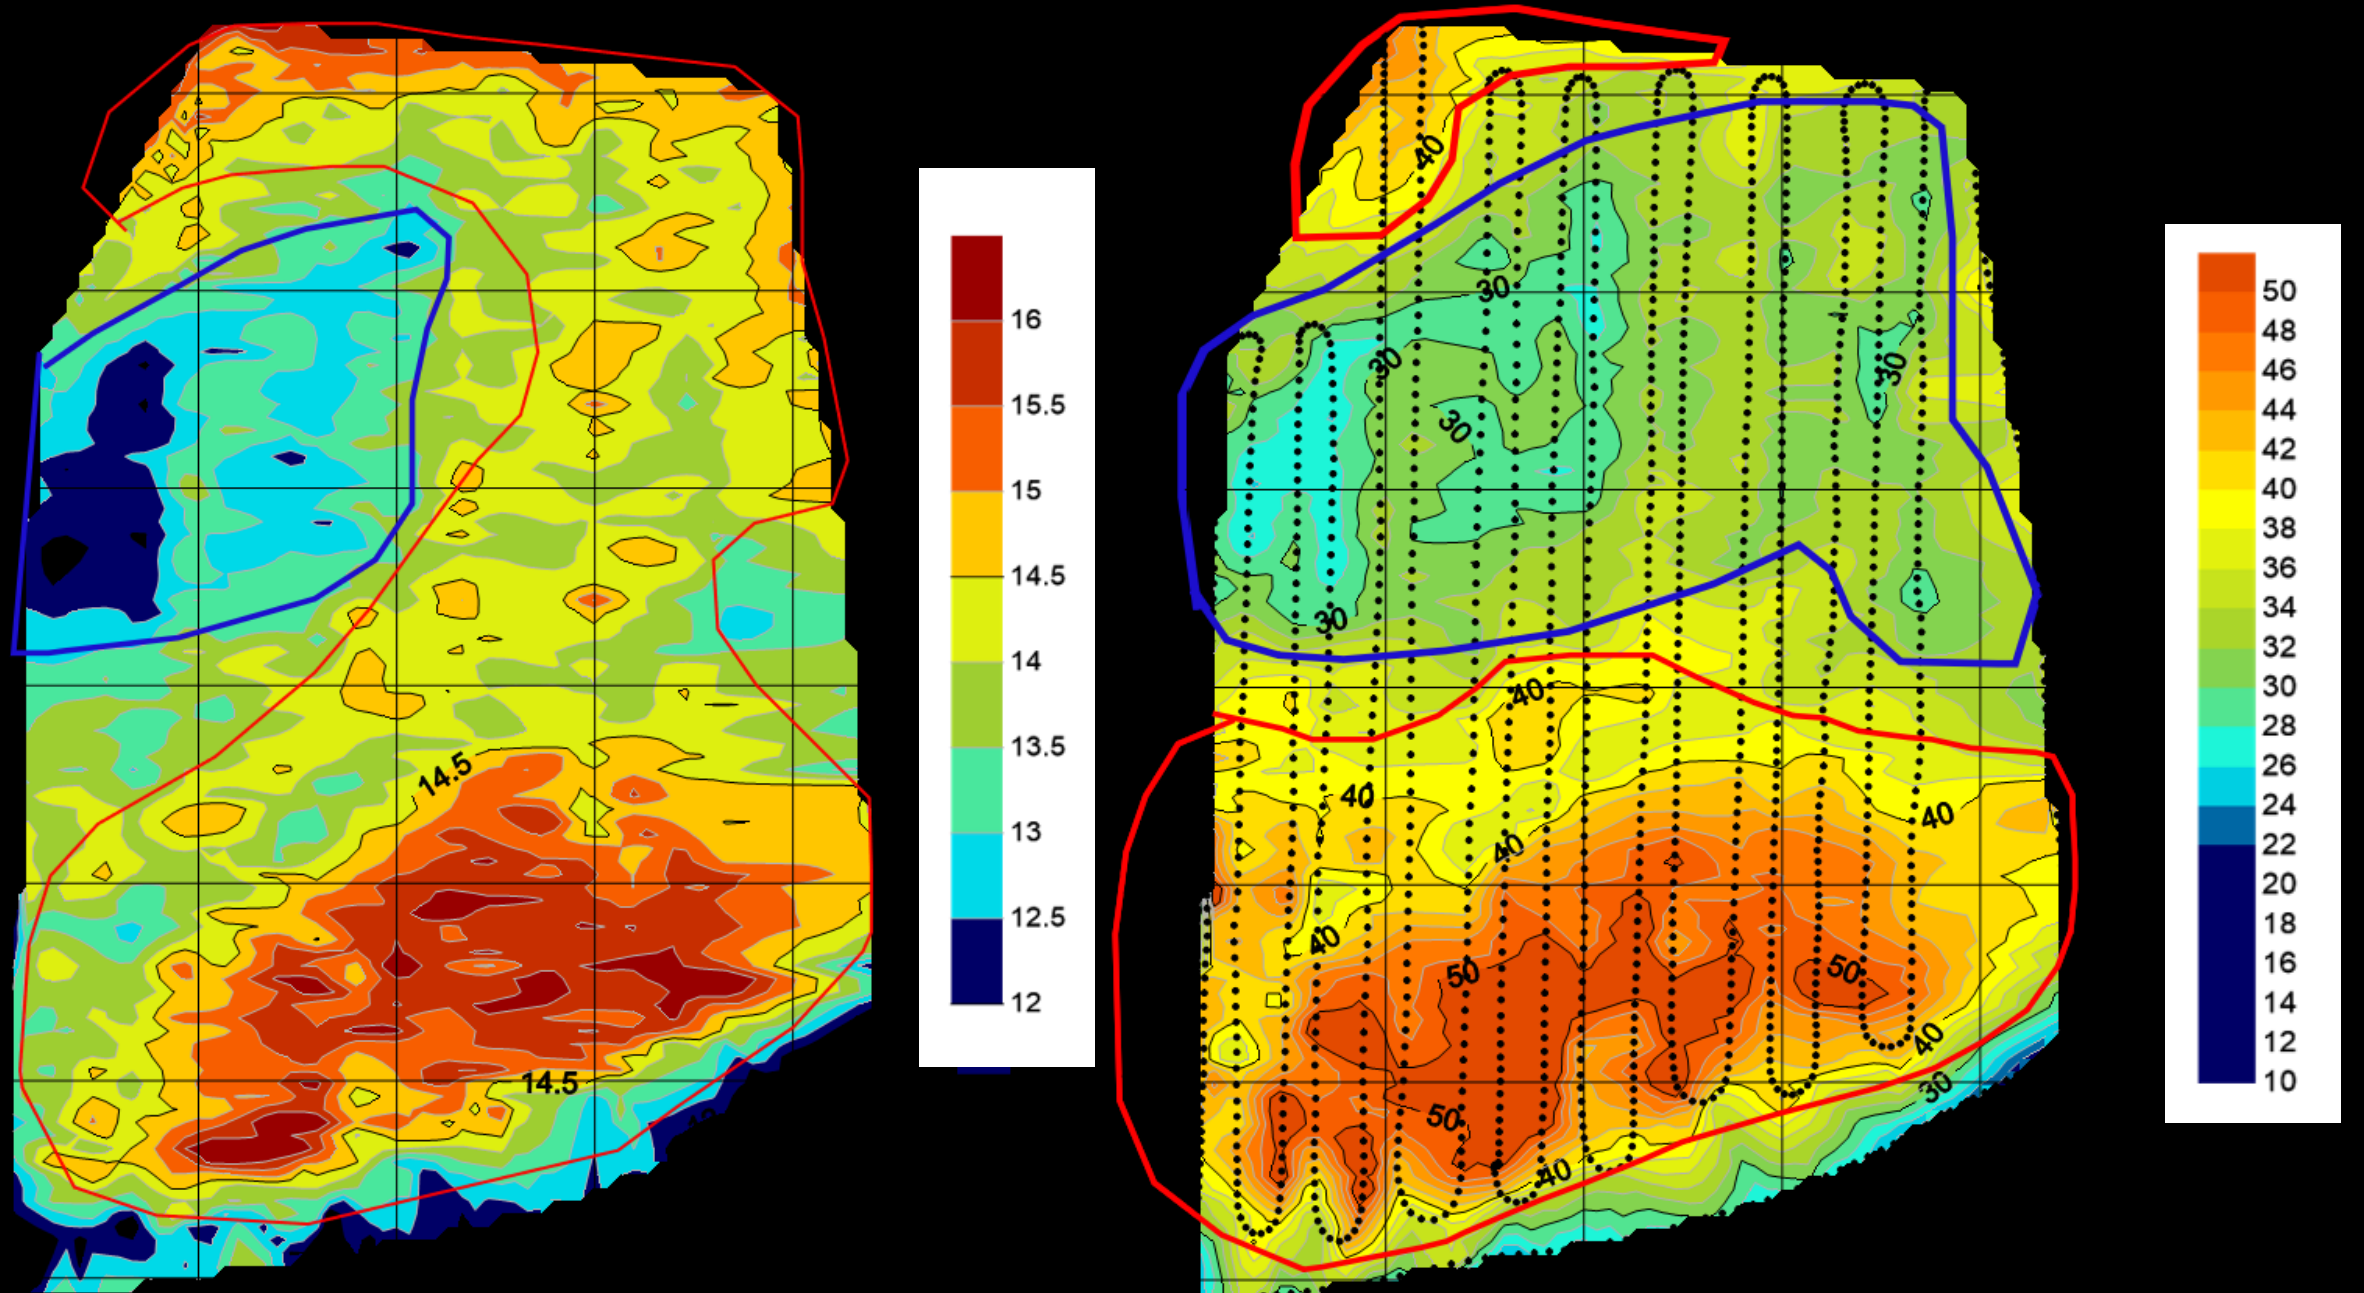

AEMP-14 is a patented device for 7-m depth earth sounding that comprises a transmitter, two receiver coils, and a backing coil. This device can operate at a set of operating frequencies picked up from 14 available frequencies (within the range from 2.5 to 250 kHz). The arrangement of receiver coils cancels the primary field in air by a factor of 1000, so there is no need for preliminary calibration for a specific ground.

AEMP-14 tests on Ag Fields

- Near Rostov-on-Don, Russia
- July 2021
- After harvest of wheat, over stubble
- Plot 1; 61 kHz

Maps of the distribution of the apparent resistivity at 5 kHz (left) and 111 kHz (right)

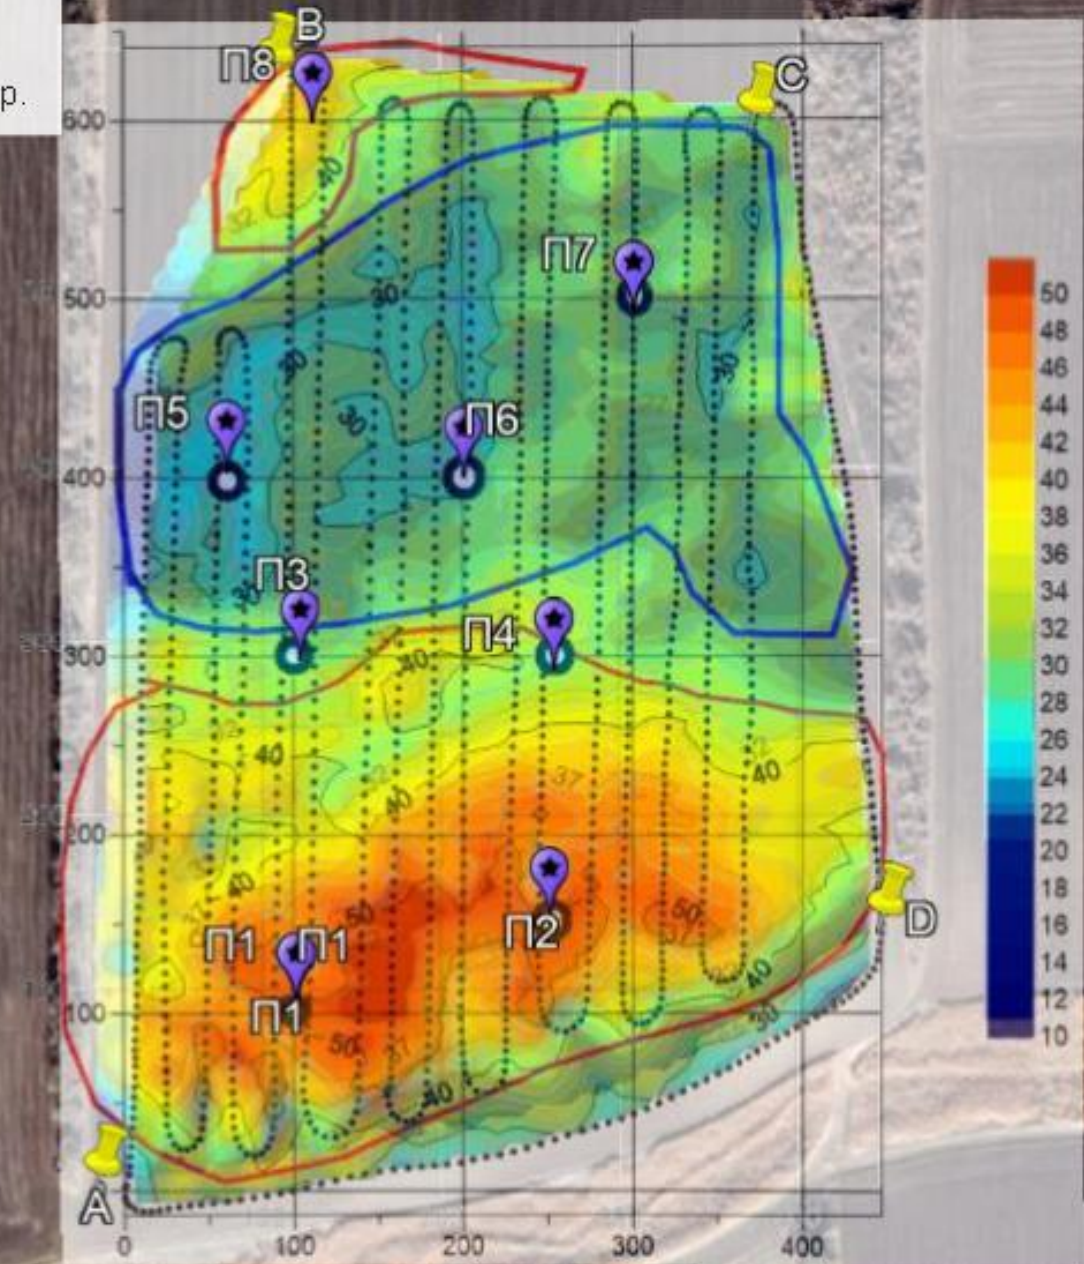

Frequencies vs Soil Properties (samples)

- ER at lower frequencies (15-25 kHz) correlated with **available water** at 50-70 cm ($R^2 = -0.87$)
- ER at higher frequencies (60 kHz) correlated with **pH** at 10-20 cm ($R^2 = 0.81$)

Geovizer

TECHNICAL SPECIFICATION

- Working frequencies: 12 kHz, 40 kHz, 111 kHz;
- Measurement time: 0.3-0,9 sec;
- Generator power: maximum 60 W;
- Receiver sensitivity: 1 mV;
- Dimensions: 90x75x25 cm;
- Working time: about 6 hours;
- Weight: 4.5 kg;
- Software compatibility: Android, Windows.

Perspective development with innovative primary field compensation method.

Let it Fly!

- To make the proper UAV platform we used DJI S1000 frame with a max payload of 6 kg.
- We changed all the control units to PixHawk flight controller and ARDUPILOT platform.
- To keep the precise height, a lidar sensor was added.
- The max speed was limited to 1 m/sec, with max angles to 35 degrees.

Harness and Target Proximity Tests

New EMGeoDrone parameters

- Generator diameter: 300 mm
- Number of turns in generator coil: 21/2
- Pump supply voltage: 8.5 V
- Receiver diameter: 50 mm
- Number of turns in receiving coil: 42
- Preamplifier gain total: 2000
- Total weight of the device without handle and footrest: 3328 g
- Distance from UAV (rope) 4 m
- Distance from ground ~ 0.8 m
