Is Our Project

Project Specifications

Inta Audio contacted Epic for product recommendations and a design that would give their customer a multizone system. The system would need produce good quality background audio levels and also be discreet to blend into the £15 million pound development. The dealership has three main areas, Jaguar Showroom, Land Rover Showroom and the Central Core which all needed to be controlled independently from the amplifier location.

Equipment Specifications:

Our commercial audio department took the client's operational requirements into account and came up with an audio design that matched their exact needs. We used the extremely popular PA-12040 4 x 120w mixing amplifier that allows up to four zones to be controlled via the front panel controls and also incorporates a matrix mixing section to assign any input to any, or all outputs. For the music source a WAP-200 internet/DAB/FM/MP3 player was used which allows the system to pick up on internet radio stations via the LAN or Wi-Fi networks, rather the client needing to have an external aerial fitted to the building which would look unsightly on such a prestigious build. The designed was completed using the EDL-620 20w 100v line flush mounted loudspeakers that incorporate the multi-tapping feature to allow the audio level to be adjusted to compensate for the variations in ceiling heights.

Equipment Itinerary:

- 1 x Monacor WAP-200 Internet/DAB/FM/MP3 Player
- 1 x Monacor PA-12040 4 x 120w Mixing Amplifier
- 14 x EDL-620 Flush Mount Ceiling Loudspeaker
