under normal conditions, in people who had not been exposed to highly toxic chemicals. His results were published online in 2011.<sup>3</sup> The study assessed the level of toxic chemicals in the visceral fat in the following four different compartments of patients undergoing elective surgery, some for cancers, others for benign conditions. This is a true In-Vivo study.

The subcutaneous fat – under your skin

The visceral fat – fat in the abdomen next to stomach, liver, and intestines

The retroperitoneal fat – fat in the area behind the stomach and next to the pancreas, kidney, adrenal gland, and major blood vessels aorta and vena cava

The pelvic fat – fat in the area of the bladder, prostate, and lower arteries

He discovered that certain substances, such as dichlorodiphenyldichloroethylene (DDE), which is a metabolite of

great

/grāt/
