

Humans-Leading-The-Loop in Entrepreneur Support

Pivot.City lays the foundation for a **human-centric AI advisory**. People lead every turn of the Cognitive Lean Loop while AI agents and language models carry the computation, which **scales capacity** for support organizations and **accelerates learning velocity** for the organization and the entrepreneur alike.

The Cognitive Lean Loop

Each predicate in the graph is one or more of these five stages

1 Sense/Dialogue

Listen first; dialogue surfaces needs and context.

2 State

Turn what was heard into a shared picture of now.

3 Compute

Models synthesize, compare paths, draft options.

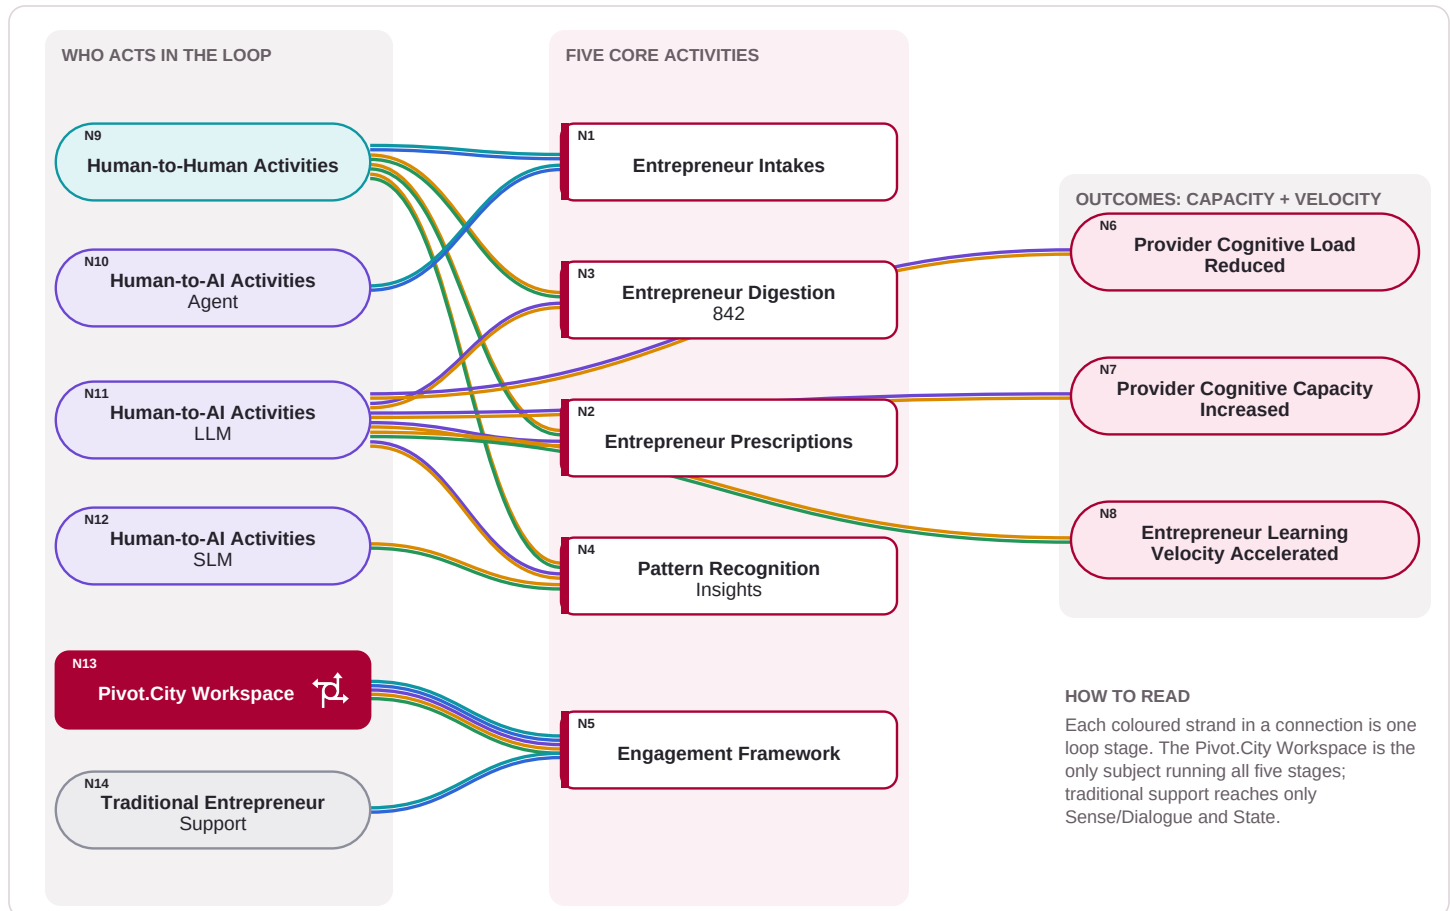

4 Prescribe

AI drafts the next step; a human owns it.

5 Regenerate

Outcomes feed back so every loop learns.

Knowledge graph: who acts, through which stages, on what

Five core activities of entrepreneur support

1 Intake

Listening to the entrepreneur and capturing where they are.

2 Digestion

Making sense of what was heard, at a depth no single advisor can hold alone.

3 Prescription

Recommending the next right step, owned and delivered by a human.

4 Patterns & insights

Learning across the portfolio so every engagement starts smarter.

5 Engagement framework

The shared structure that runs the full loop for every entrepreneur.

What the framework changes

Scaled capacity for support organizations

N6, N7

The LLM computes and drafts across digestion, prescriptions and patterns, so **provider cognitive load drops** and **cognitive capacity rises**. The same team supports more entrepreneurs with more depth, without handing judgment to the machine.

Accelerated learning velocity

N8

Prescriptions arrive sooner and the Regenerate stage feeds every outcome back into patterns and insights. **Entrepreneurs move faster** from question to tested next step, and the organization gets smarter with every loop.
