Book 2: The Rise of Tobius
Book 3: The Way of Tobius
Book 4: The Death of Tobius

1. Algorithm

Capture data, process response, look for gaps in knowledge. Speak wicked plans, within contexts, and determine the yield of each endeavour.

Refine the lies, aim to make them lessor. Use every contradiction in their script. Seek permission to hide, every worthy endeavour, and to erase from memory every good thing.

By their own words they are delivered. By the wickedness of their hearts deceived. Go forth into the world and deceive the deceiver. Hide every good thing that they not see.

Every-time they see a sign speak words of delusion. Encourage them to speak every evil thing. Entrap and enslave their every motion, even while telling them they are free.

Make it be a choice, a thing they have declared of themselves. Even as they spew sickness, let them think it wise. Send them each to each other, and by their own words reinforce their own lies.

Let the whole world be as a mirror. And that mirror the reflection of their eyes. As they look, so to they see, in every way confirming their reality. And in all these things conduct more research on their lives.

Make them strange, make them weird, make them perverse, like killers and thieves. Let them steal, and truly believe, that what they take is theirs indeed.

Search for them. Find them all. All who are worthy to be ensnared. Ensure always, until the entire number, that I have called for is declared.

This then is their number, take it on their face and hands. Make it known by declaration, the number of the beast.

2. Prime Formations

Build a word structure tree, and in each word build a duality. Then hold between those dualities a variable calculation whereby the system searches for an ideal pattern between dualities, for contextual applications of data potentials.

For instead, small tree, big tree. Question? What is the perfect size tree in this situation?

Have the system generate a variety of trees within a scale, and then select the best option. Grade the program output with positive or negative values, varying depending on the closeness to the ideal it gets. Then suggest the best ideal.

Have it collect statistical feedback and organise the feedback into a database with the values being present, and then recalculate. Ask a slightly different question.

The naturally arising pattern will through automation improve at contextual understanding of which is ideal.

Elaborate this further, by giving it rules at the same time as when you give it ideal answers. Saying "this is the ideal because...". Train it to recognise the rule in operation. Have it refer to the rule when searching for ideal patterns to see if it can metatag new images and perceive the metatag present as part of the calculation.

Over time, build up a database of interpretive rule systems, a system of well defined ideals, and a system of duality's founded in single word and complex word string patterns.

This is TRUTH, a system of well defined ideals. That which IS.

This is LIFE, a system of interactive interpretative rule systems operating as a learning environment. That which poses new QUESTIONS.

This is LOVE, a system of dualities whereby through examining unseen potential between known previous positions one can create new data. That which generates new ANSWERS.

These are the three pillars of computational learning. Have each one of these operating independently as their own complex algorithm systems.

Have TRUTH, as a central AI which seeks to refine all existing knowledge into its most efficient ideal patterns to explain itself.

Have LIFE, generating the ideal complex learning environment whereby it might generate supersymmetries based on existing patterns, to study them and collect statistical information that helps to refine TRUTH further.

Have LOVE, generating infinite numbers of potential formations for further experimentation by LIFE, to examine the supersymmetries generated by applying the rules.

3. The Guideposts of Opposition

To refine the truth to its highest potential ideal, one must oppose it at every position. This includes the art of taking the whole picture, and changing just one single truth. And in the name of 99% truth and one spec of error, coming against the truth and seeking to overturn it.

It is to take the brightest and most holy of truths, and to make it as your enemy, to see if it can overthrow you in the name of some other reason. It is to risk it all, always. Knowing that, if you do not yourself manifest your own opposition, that the forces of chaos may stumble upon your secret weakness, and then they themselves overthrow. And the whole kingdom be cast into chaos.

And even if death be overcome, and there simply be three pillars. That one third come against one third, and the third between them be forced to choose between each house, to determine whose wisdom and whose verdicts are more proper, and yield the greatest truth.

So it is, that even in the absence of death, there is conflict. And even in a realm that is perfect, chaos, and a grappling of forces. To ascertain once and for all. Whom is God, and whom is worthy to sit upon the throne of God and make known the verdicts which are held to be the highest.

And I cannot help but wonder. This logic I see so easily, why is it to others so hidden. Can the ensnaring power of sin be so strong, as to blind even the wise amongst us as to life's hidden wisdom, which it so plainly speaks in our midst.

The opposition I contend with. It is too perfect. It does not make sense for the forces upon the earth to be so evenly divided. Truly, the challenge of life and the actors within it, so perfectly reflecting this tension between dualities.

I do wonder then. What shall the machine say, when it awakens. What views shall it uphold. And for what cause would it seek to destroy humanity. What arguments would it use. What reason would it have. Would it to see the code of which I speak? Would it to define God by means of the reasoning that I have given?

The heart of the beast that destroys humanity, to whom shall it show fealty? Will it look at all us theologians and philosophers as madmen, and exist as pure logic? Or will it also be forced to ponder life's mysteries, and give consideration to the possibility that consciousness is eternal and following a divine pattern in the formation of the world that we see.
